California Water Service Company 2010 Urban Water Management Plan Contact Sheet

This plan was prepared by the Water Resource Planning Group in California Water Service Company's Engineering Department. Thomas A. Salzano, Water Resources Planning Supervisor, is responsible for the plan's preparation and can be reached at the address and telephone number listed below:

General Office: California Water Service Company

1720 North First Street San Jose, CA 95112

E-mail address: **tsalzano@calwater.com**

Phone: (408) 367-8340

Fax: (408) 367-8427

District Office: California Water Service Company-Rancho Dominguez District

2632 W. 237th St. Torrance, CA 90505

District Manager: Henry Wind

District Phone: (310) 257-1400

1 Plan Preparation

California Water Service Company (Cal Water) is an investor-owned public utility supplying water service to 1.7 million Californians through over 435,000 connections. Its 24 separate water systems serve over 63 communities from Chico in the north to the Palos Verdes Peninsula in Southern California. California Water Service Group, Cal Water's parent company, is also serving communities in Washington, New Mexico and Hawaii. Rates and operations for districts located in California are regulated by the California Public Utilities Commission (CPUC). Rates are set separately for each of the systems. Cal Water has been in continuous operation in California since 1926 and has provided water service to the Dominguez service area since 2000; however, the Dominguez Services Corporation has been serving the customers of this district since 1911.

1.1 Purpose

California Water Code §10644(a) requires urban water suppliers to file with the Department of Water Resources, the California State Library, and any city or county within which the supplier provides water supplies, a copy of its Urban Water Management Plan (UWMP), no later than 30 days after adoption. Cal Water will follow the California Water Code and file an UWMP at least once every five years on or before December 31, in years ending in five and zero.

All urban water suppliers as defined in Section 10617 (including wholesalers), either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet annually are required to prepare an UWMP

This UWMP is a foundation document and source of information for a Water Supply Assessment and a Written Verification of Water Supply. An UWMP also serves as:

- ♦ A long-range planning document for water supply,
- Source data for development of a regional water plan, and
- A source document for cities and counties as they prepare their General Plans.
- A key component to Integrated Regional Water Management Plans.

1.2 Coordination

Cal Water completed a draft of the UWMP for Dominguez District on Month xx, 2010. The draft was sent to the agencies listed in Table 1.3-1 for review and comment. Copies of the draft plan were available at the Cal Water Corporate Office in San Jose and at the district office for public review and comment.

Table 1.2-1 summarizes Cal Water's attempts to include various agencies in the planning process of this UWMP.

Table 1.2-1: Coordination with Appropriate Agencies (Table 1)

Cal Water conducted a formal public meeting to present information on its Dominguez District UWMP on June 8, 2011, from 3:00-5:00 p.m. at the following location:

California Water Service Company Rancho Dominguez Customer Service Center 2632 W. 237th Street Torrance, CA 90505

Proof of the public meeting is presented in Appendix A

1.3 Plan Adoption

The deadline for final comments was June 15, 2011. The final plan was adopted by the Vice President of Engineering & Water Quality on June 24, 2011 and was submitted to California Department of Water Resources within 30 days of approval. Appendix A presents a copy of the signed Resolution of Plan Adoption. In addition to the resolution, Appendix A also contains the following:

- Any comments received during the public review of this plan.
- Minutes from the public meeting.
- Correspondence between Cal Water and participating agencies.

1.4 Water Management Tools

Cal Water uses the following water management tools to optimize management of water resources for the District:

- <u>Computerized Hydraulic Model</u> for analysis of various operating conditions within the water distribution network and for planning operational and facility improvements. For smaller systems, a simple model is maintained that only models trunk lines, key sources, and major delivery points.
- <u>Supervisory Control and Data Acquisition (SCADA)</u> system that provides information as to how the water system is operating, provides operational control functions, and maintains a historical record of selected data.
- Revenue Management Solutions (RMS) is an information system that Cal Water uses to maintain detailed historical records including the water sales and customer service connections.
- <u>District Report on Production (DROP)</u> is a database that maintains water production data for wells and purchased amounts from wholesale service connections.
- <u>Geographical Information Systems (GIS)</u> that combines multiple sources of information and allows data to be electronically mapped for analysis and understanding of growth and constraints on land development and water use.
- <u>Laboratory Information Management System (LIMS)</u> provides water quality data for detailed constituent analysis of raw and finished water, determination of compliance with state and federal drinking water standards, and trends in water quality changes.
- Water Supply and Facilities Master Plan for identification of near and long term capital improvement projects for water system facilities and equipment using all of the above tools and Cal Water experience in design and construction.
- Computerized Maintenance Management System (CMMS) is a computerized database system that tracks asset data, assigns and schedules maintenance work orders, and reports on maintenance related activities. A CMMS allows a business to manage maintenance work more effectively and is a stepping stone towards Asset Management (AM).
- <u>Groundwater Level Monitoring Program</u> tracks groundwater fluctuations over time and is used to inform resource management and well maintenance decisions.

1.5 Plan Organization

This plan is organized as described in the following outline. The corresponding provisions of the California Urban Water Management Planning Act are included as references. Tables in this plan have cross-references to the tables as listed in the "Guidebook to Assist Water Suppliers to Prepare a 2010 Urban Water Management Plan" prepared by the California Department of Water Resources.

Section	Table 1.5-1: Plan Organization	Act Provision
Contact Sheet	<u>List of Contact Persons</u>	-
Section 1	Plan Preparation This section describes the requirement and the purpose of the Urban Water Management Planning Act, coordination, plan adoption, schedule, and management tools.	\$10620 (d)(2) \$10621(a -b) \$10635(b) \$10642 \$10643 \$10644 (a) \$10645
Section 2	System Description This section describes the District service area and includes area information, population estimate, and climate description.	§10631 (a)
Section 3	System Demands This section describes the water supply projection methodology used to estimate water demands and supply requirements to 2040. It also includes a discussion of SBx7-7 baselines and targets.	\$10631 \$10608.20(e)
Section 4	System Supplies This section includes a detailed discussion of the water supply sources.	\$10631 \$10633 \$10634
Section 5	Water Supply Reliability and Water Shortage Contingency Planning This section includes a discussion of the water supply reliability and describes the District's planning for water shortages during drought and emergency situations.	\$10620 \$10631 (d) \$10632 \$10634 \$10635 (a)
Section 6	Demand Management Measures This section describes Cal Water's conservation programs.	§10631
Section 7	Climate Change This section contains a discussion of climate change.	
Section 8	DWR Checklist This section includes the completed DWR UWMP Checklist.	
Appendix A	Resolution To Adopt The Urban Water Management Plan This section includes the following: 1) Resolution 2) Letters to and comments from various agencies 3) Minutes from the public meeting 4) Correspondence between Cal Water and participating agencies.	\$10621 (b) \$10642 \$10644 (a)
Appendix B	Service Area Map This appendix includes the service area map of the District as filed with the Public Utilities Commission.	-
Appendix C	Water Supply, Demand, And Projection Worksheets This section includes the spreadsheets used to estimate the water demand for the District.	-

Section	Table 1.5-1: Plan Organization	Act Provision
Appendix D	DWR Groundwater Bulletin 118 Sections from the Department of Water Resources Bulletin 118 are included as reference and provide details of the basin for the District.	§10631 (b)(1-4)
Appendix E	Tariff Rule 14.1 Water Conservation And Rationing Plan This section contains the tariff rule for reference.	-
Appendix F	Water Efficient Landscape Guidelines This section contains the Guideline for Water Efficient Landscape that Cal Water uses at its properties, including renovations.	-
Appendix G	Conservation Master Plan This section contains the District's Conservation Master Plan.	§10631 (j)
Appendix H	Purchase Agreement and Adjudication Order for the West Coast Basin Copies of the following are attached as reference: Purchase Agreement West Basin Municipal Water District Adjudication Order	§10631 (b)(1-4)
Appendix I	Central Basin Adjudication Order The adjudication order for the Central Basin is attached for reference	§10631 (b)(1-4)
Appendix J	WRD Strategic Plan This section contains the groundwater management plan.	§10631

1.6 Implementation of Previous UWMP

Cal Water will follow the California Water Code and file an UWMP at least once every five years on or before December 31, in years ending in five and zero. Since Cal Water operates 24 separate service districts the UWMP for each district has historically been submitted every third year to coincide with its California Public Utilities Commission (CPUC) general rate case (GRC) schedule. This method divided the districts into three sets that followed an established three-year schedule. The Plan for the Dominguez District was last submitted as part of the 2005 grouping. Cal Water has since eliminated these groupings and will now file a GRC for all districts every third year and an UWMP every fifth year.

2 System Description

2.1 Service Area Description

The Dominguez District is located at the southern portion of the Los Angeles coastal plain, in the area known as the "South Bay", see Figure 2.1-1. Its 35-square-mile service area, located approximately five to ten miles inland from the Los Angeles Harbor, includes the majority of the City of Carson, a large section of the City of Torrance, small sections of the Cities of Compton, Long Beach and Los Angeles and a portion of Los Angeles County. The northwest and west section of the service area is adjacent to Cal Water's Hermosa-Redondo District. The system is surrounded by the cities of Long Beach, Compton, Torrance, Redondo Beach and Los Angeles. Water purveyors to these cities are the City of Long Beach, City of Compton, City of Torrance, the Southern California Water Company, Cal Water's Hermosa-Redondo District and the Los Angeles Department of Water and Power (LADWP).

Major transportation links in the District include the San Diego Freeway (Interstate 405), the Harbor Freeway (Interstate 110), the Long Beach Freeway (State Highway 710), Torrance Boulevard, Crenshaw Boulevard, Carson Street, Del Amo Boulevard, Avalon Boulevard, Wilmington Avenue, Victoria Street, Sepulveda Boulevard and Alameda Street. The Los Angeles International Airport (LAX) is about ten miles north of the heart of the District. The Southern Pacific Railroad and the Atchison, Topeka and Santa Fe Railroad both serve the industries in the district as well as the Los Angeles and Long Beach Harbors south of the District.

Major geological features of the region include the Palos Verdes Fault Zone, which, along with the Cabrillo Fault, is responsible for the uplift of base rock that forms the Palos Verdes Peninsula adjacent to and south of Hermosa-Redondo, see Figure 2.1-2. The Newport-Inglewood Fault, which has been identified as one of the most dangerous faults in the Los Angeles area, lies directly under the District. A major earthquake on either of these faults may disrupt water service. The Dominguez Hills, home to California State University Dominguez Hills and one of Cal Water's largest tank sites, is a surface expression of the Newport-Inglewood fault system. The Dominguez Channel provides the principal storm drainage for the District's service area.

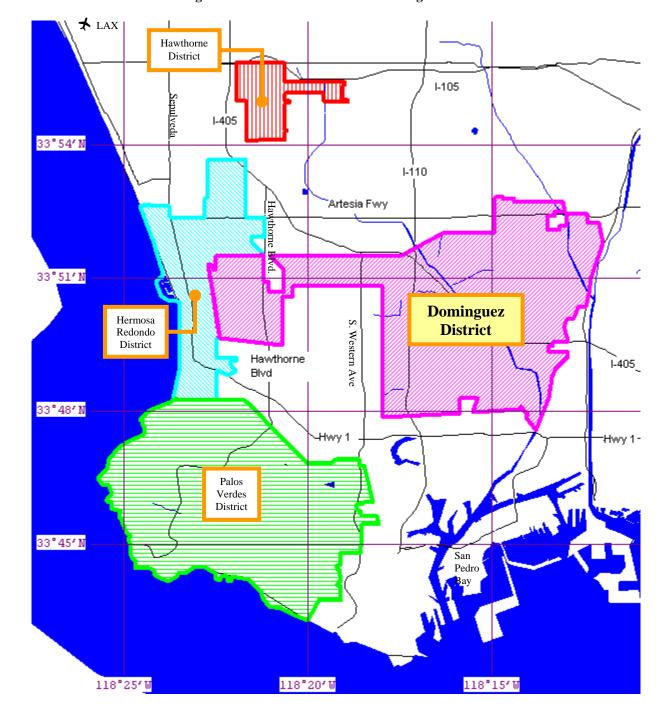

Figure 2.1-1: General Location of Dominguez District

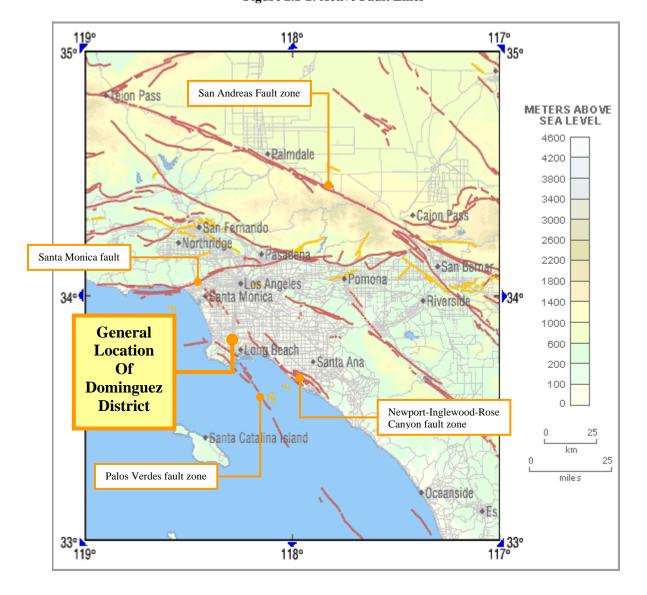

Figure 2.1-2: Active Fault Lines¹

 $^{{1\}atop U.S.\ Geological\ Survey,\ Earthquake\ Hazards\ Program,\ URL\ http://quake.wr.usgs.gov/info/faultmaps/index.html}$

2.2 Service Area Population

Based on 2000 U.S. Census data, considering actual service connection growth and assuming that density has remained unchanged since the census was conducted, Cal Water estimates that as of December 2009, the District's population is approximately 144,190. A density of 4.75 persons per residential service (single family services plus multifamily units) was used for this estimate.

The process for estimating population in the Dominguez District began by overlaying the U.S. Census 2000 Block data with the Cal Water service area map (SAM), as shown in Figure 2.2-1.

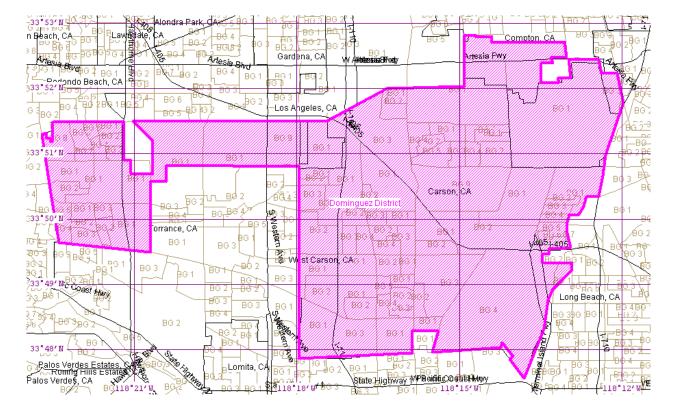

Figure 2.2-1: Approximated SAM with US Census 2000 Tract Map

A summary of the census data for the year 2000 is shown in Table 2.2-1. LandView 5 and MARPLOT ® software were used to generate the data¹.

Table 2.2-1: Summary of Census 2000 Data					
Census Tract Blocks Population Housing Units					
Dominquez Service Area	889	139,558	44,631		

This data was used as a baseline for estimating population starting in 2000. To calculate estimated population after 2000, the Census 2000 population was then divided by the total number of dwelling units served by Cal Water in 2000 to produce a population density value. This value was then multiplied by the number of Cal Water dwelling units in each future year.

To establish a range of future service counts the five-year, ten year, and Master Plan projected growth rates for each service type were continued through 2040. The 5-year is the short-term growth rate calculated from 2005 to 2009, which has an overall annual average growth rate of 0.15 percent. The 10-year average is a long-term growth rate, calculated from 2000 to 2009, which exhibits an overall annual average growth rate of 0.31 percent.

The Water Supply and Facilities Master Plan (WSFMP) for the Dominguez District presents an alternative methodology for projecting the number of future services by revenue class. The methodology used involves developing a service factor in af/service/yr that can then be used with the projected demand, by revenue class, to predict the number of services in a particular year. Service factors for each revenue class were calculated by dividing the historical consumption by the historical number of services. Future services were projected by adding the incremental number of services due to an increase in water demand to the previous year's number of services. A comparison of service connection growth rates is shown in Figure 2.2-2.

¹ LandView 5 and MARPLOT ® software, US Census Bureau/Environmental Protection Agency, downloaded from: http://www.census.gov/geo/landview/lv5/lv5.html, http://www.epa.gov/ceppo/cameo/marplot.htm

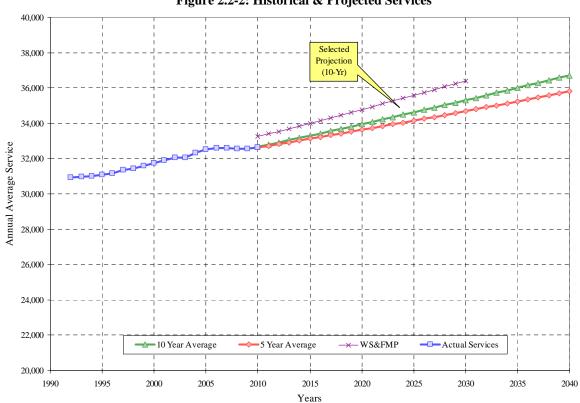

Figure 2.2-2: Historical & Projected Services

Cal Water estimates the service area's population could reach 160,970 by 2040. Table 2.2-2 lists the population growth in 5-year increments.

Table 2.2-2: Population - Current and Projected (Table 2)								
2005 2010 2015 2020 2025 2030 2035 2040								
Service Area Population	142,420	143,830	146,550	149,330	152,160	155,040	157,980	160,970

Cal Water's population projections based on District service counts are compared to South California Association of Governments (SCAG) Census Data and are presented in Figure 2.2-2.

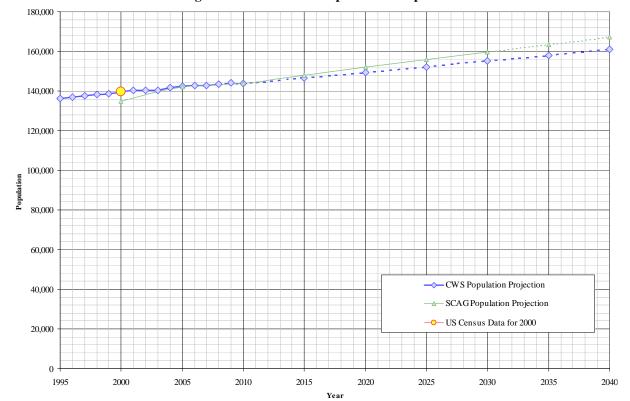

Figure 2.2-3: Estimated Population Comparison

The population projections using the SCAG data assumed that Cal Water provided service to the following percentages of each city:

- **♦** 100% of Carson City
- **♦** 30% of Torrance City
- ♦ 2.5% of unincorporated areas of the South Bay Cities Association

From the graph above, it is shown that the growth rate projected by Cal Water is similar to that the projected rate of increase from SCAG.

Similarly, the housing count was estimated by comparing the US Census 2000 data and the service counts for the Dominguez District, Figure 2.2-3. The service count for the year 2000 is lower than the US Census 2000 housing units estimate. This is most likely the result of District service connections including one meter that serves several housing units, such as duplexes or apartments, whereas the US Census data combines all of the housing units (single and multifamily residences). The US Census 2000 housing unit figures were established by summarizing the individual census blocks enclosed within the service area of the District.

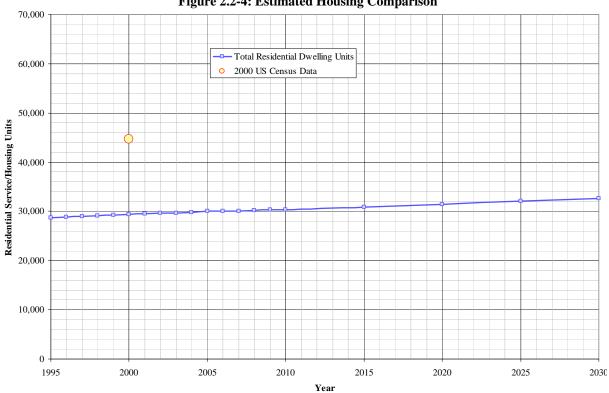

Figure 2.2-4: Estimated Housing Comparison

2.3 Service Area Climate

The Dominguez District area has a Mediterranean coastal climate and usually enjoys mild dry summers and cool winters. Table 2.3-1 lists the average annual conditions for the weather station in Torrance, which is the closest station to the District.

Table 2.3-1: Average Annual Climate				
Average Temperature	Average Temperature Average Rainfall			
62.1°F	13.5 inches	46.6 inches/month		

Figure 2.3-1 displays the average monthly temperature and rainfall.

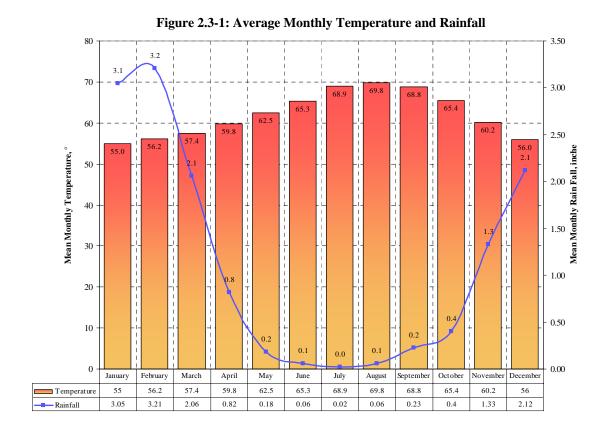

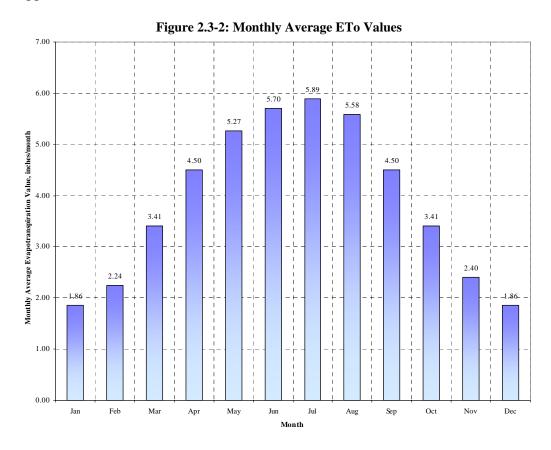

Figure 2.3-2 displays the monthly average evapotranspiration values for the area of the District³. Evapotranspiration is the sum of water loss from a watershed because of the processes of evaporation from the earth's surface and transpiration from plant leaves. The annual estimated transpiration for Dominguez is 46.6 inches. The average annual rainfall of 13.5 inches is only 35 percent of the annual total evapotranspiration value. This indicates that the Dominguez District is located in a water-deficient environment. The dry landscape with poorly developed soils and scrubby vegetation are evidence of this low amount of naturally available water. Additional climate data is provided in the Appendix C, worksheet 18.

³ California Irrigation Management Information System (CIMIS), EvapoTranspiration (Eto) Zones Map - Zone 15, http://www.cimis.water.ca.gov/cimis/welcome.jsp

3 System Demands

3.1 Distribution of Services

Cal Water designates the different customer connection categories as follows:

- Single Family Residential
- Multifamily Residential
- Commercial
- Industrial
- Government
- Other

The average annual services for the calendar year 2010 numbered 32,629. Single Family Residential services totaled 28,574, or 88 percent of all services; multifamily residential services totaled 704 or 2 percent; and commercial totaled 2,866 or 9 percent. All other customer classes comprised the remaining 1 percent. The distribution of services for the year 2010 is shown in Figure 3.1-1.

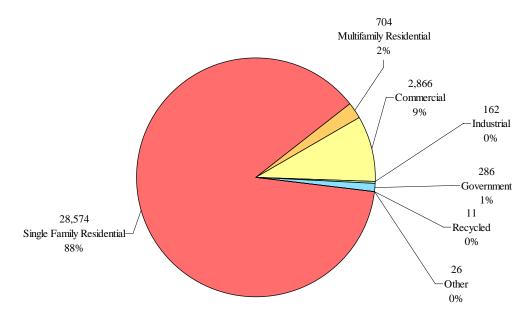

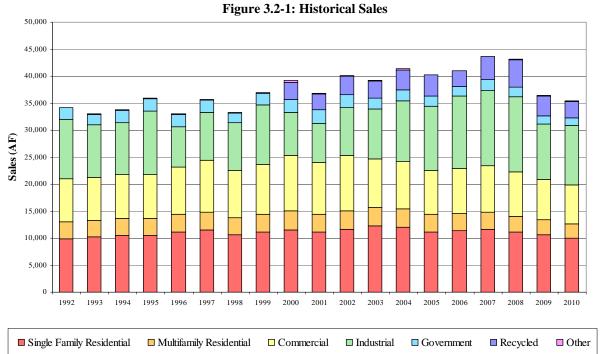

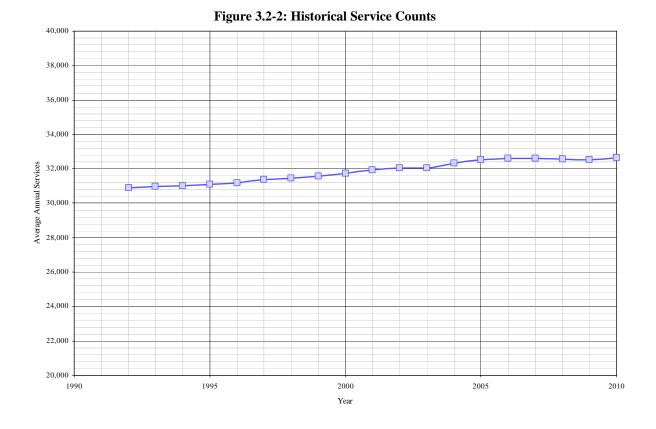

Figure 3.1-1: Distribution of Services (2010)

3.2 **Historical and Current Water Demand**

Historical sales values are illustrated in Figure 3.2-1. Historical service counts are illustrated in Figure 3.2-2.

Demand per service was established as a function of historical sales data for each customer class and the annual average service count for that class. From 1992 to 1998, the combined demand per service for all service categories remained fairly stable at an annual average of 370,000 gallons per service. Since then, demand per service has increased steadily to above 400,000 gallons per service per year. This increase is driven by the availability of recycled water used principally in the industrial sector. Single family residential demand per service has remained relatively constant with an average of 129,000 gallons per year.

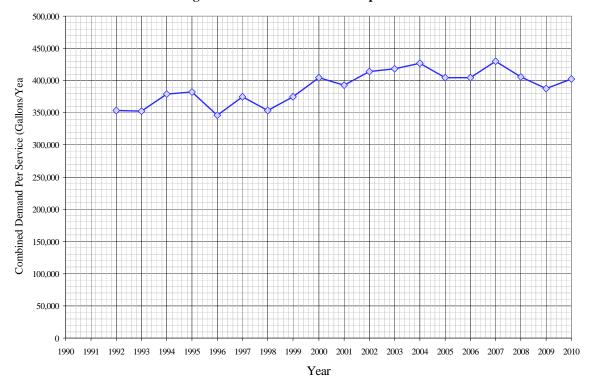

Figure 3.2-3: Historical Demand per Service

Single family residential customers, who make up the largest customer class at 88 percent of all services, have the smallest demand per service. As a result, this category uses only 24.6 percent of the total demand. Multifamily residential use accounts for 6.6 percent of the total demand, for a combined residential total of 31.2 percent. Industrial services are less than 1 percent of all services yet they account for 27.2 percent of the total demand. Unaccounted for water in 2010 equaled 8.6 percent, which is high for Cal Water districts, but is within acceptable levels.

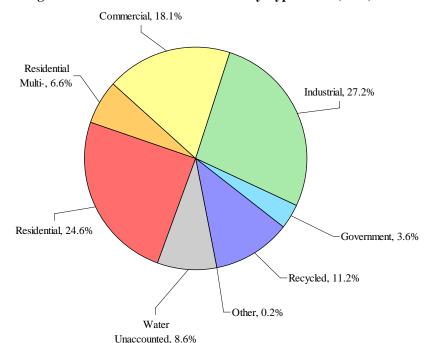

Figure 3.2-4: Percent of Total Demand by Type of Use (2010)

3.3 Water Demand Projections

Cal Water has historically made its water demand projections by first calculating individual growth rates for each of its service connection types. These growth rates were based on five or ten year averages of service count data, and were extended over the planning horizon resulting in projected service counts. A set of three demand per service values (low, average, high), which were based on past customer usage records, were then applied to the projected service counts to calculate projected water demands for each service type. Due to the passage of Senate Bill 7 (SBx7-7) this method is no longer used as the primary method for calculating projected demands. However, these calculations are still used as the basis for calculating projected services, population, and the distribution of demand amongst service connection types.

The method used in this UWMP to determine future water demands is a response to SBx7-7 requirements. It results in two demand projections; the unadjusted baseline

demand, and the target demand. The unadjusted baseline water demand projection is the total demand expected without any achieved conservation. It is equal to forecasted population multiplied by the 2005-09 average, or 225 gpcd.

The target water demand projection includes conservations savings due to both passive and active demand management, which are described in Section 6. The target demand is calculated by multiplying SBx7-7 target gpcd values and projected population. These conservation savings are illustrated in the comparison of projected demands shown in Figure 3.3-1.

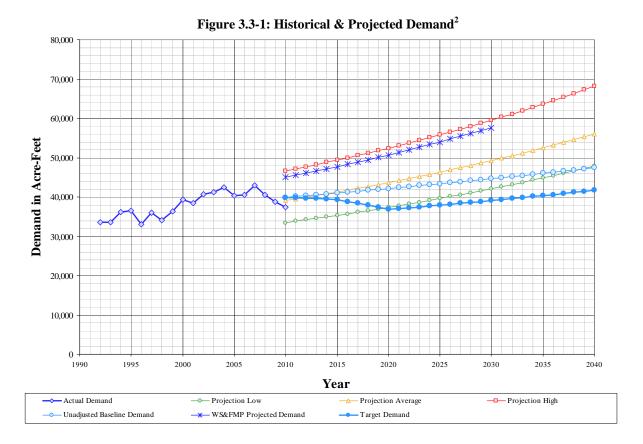

Figure 3.3-1 also shows the demand projection that was developed in Cal Water's Water Supply and Facilities Master Plan for the Dominguez District. In this case water demands were projected using a unit demand methodology based on land uses. This projection calculates demands based on past water use levels and does not include savings as a result of increased conservation actions. It is included here to provide a comparison to demands calculated for the purposes of SBx7-7 compliance.

² To provide a realistic estimate of actual future water demands, the unadjusted baseline and target demands shown here were calculated without the indirect recycled water use credit as allowed by SBx7-7, and also include projected direct deliveries of recycled water.

The water demand projection calculation used for SBx7-7 compliance relies only on future population and gpcd target values. Projected water deliveries separated by customer type can not be determined by this method alone. To get a breakdown of future deliveries Cal Water used the ratio of individual deliveries for each class to the total amount that was developed for the previously used water demand projection. This ratio was applied to the total adjusted baseline demand, which resulted in the projected deliveries listed in Tables 3.3-1 through 3.3-6. These demands include the conservation savings associated with the demand management measures described in Section 6.

3.3.1 Senate Bill No. 7 Baselines and Targets

Cal Water is in the process of expanding current conservation programs and developing new programs for its 24 service districts. Over the next five years, Cal Water conservation program expenditures are likely to increase significantly due in large measure to recently adopted state policies requiring significant future reductions in per capita urban water use. These include the passage of Senate Bill No. 7 (SBx7-7) in November 2009, which mandated a statewide 20 percent reduction in per capita urban water use by 2020, as well as recent decisions by the California Public Utilities Commission (CPUC) directing Class A and B water utilities to adopt conservation programs and rate structures designed to achieve reductions in per capita water use, and the *Memorandum of Understanding Regarding Urban Water Conservation in California* (MOU), of which Cal Water has been a signatory since 1991. In preparing for this program expansion, Cal Water has spent the past year developing five-year conservation program plans for each of its service districts. The complete Dominguez District Conservation Master Plan is included as Appendix G.

SBx7-7, which was signed into law in November 2009, amended the State Water Code to require a 20 percent reduction in urban per capita water use by December 31, 2020. Commonly known as the 20x2020 policy, the new requirements apply to every retail urban water supplier subject to the Urban Water Management Planning Act (UWMPA).

The state is required to make incremental progress toward this goal by reducing per capita water use by at least 10 percent on or before December 31, 2015. SBx7-7 requires each urban retail water supplier to develop interim and 2020 urban water use targets in accordance with specific requirements. They will not be eligible for state water grants or loans unless they comply with those requirements.

The law provides each water utility several ways to calculate its interim 2015 and ultimate 2020 water reduction targets. In addition, water suppliers are permitted to form

regional alliances and set regional targets for purposes of compliance. Under the regional compliance approach, water suppliers within the same hydrologic region can comply with SBx7-7 by either meeting their individual target or being part of a regional alliance that meets its regional target. Cal Water intends to enter regional alliances with other Cal Water districts falling within the same hydrologic regions as listed in Table 3.3-7. Dominguez District is one of five Cal Water districts within the South Coast hydrologic region. For these districts, Cal Water has calculated both district-specific targets and a regional target. While the regional target approach is not necessary for Dominguez District compliance, it does allow two of the districts that would otherwise be unable to achieve their district-specific targets to comply with SBx7-7 requirements.

Table 3.3-7: Cal Water Districts Sorted by Hydrologic Region				
Hydrologic Region Cal Water Districts in Region				
North Coast	Redwood Valley			
San Francisco Bay Area	Bear Gulch, Livermore, Los Altos, Mid-Peninsula,			
South San Francisco				
Central Coast	King City, Salinas			
South Coast	Dominguez, East LA, Hermosa-Redondo, Palos			
	Verdes, Westlake			
Sacramento River	Chico, Dixon, Marysville, Oroville, Willows			
San Joaquin	Stockton			
Tulare Lake	Bakersfield, Kern River Valley, Selma, Visalia			
North Lahontan	None			
South Lahontan	Antelope Valley			
Colorado River	None			

District-specific and regional targets for Cal Water districts within the South Coast hydrologic region are shown in Table 3.3-8. The 2015 and 2020 district-specific targets for Dominguez District are 193 and 171 gpcd, respectively. Over the last five years district demand, net of both direct and indirect recycled water use, has averaged about 203 gpcd. Thus, per capita demand will need to decrease by about 5 percent by 2015 and by 16 percent by 2020 in order to meet the district-specific targets.

Table 3.3-8: Regional SBx7-7 Targets for Cal Water Districts in South Coast Hydrologic Region							
District Population 2015 Target 2020 Target							
Dominguez	144,190	193	171				
East Los Angeles	148,740	121	115				
Hermosa-Redondo	94,070	134	126				
Palos Verdes	67,620	253	225				
West Lake	16,740	442	393				
Regional Targets ¹ 176 160							
¹ Regional targets are the population-weighted a	average of the district targ	gets.					

The following analysis presents the individual SBx7-7 compliance targets for the Dominguez District.

Under SBx7-7, an urban retail water supplier may adopt one of four different methods for determining the 2020 gpcd target:

- 1. Set the 2020 target to 80 percent of average GPCD for any continuous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.
- 2. Set the 2020 target as the sum of the following:
 - a. 55 GPCD for indoor residential water use.
 - b. 90 percent of baseline CII water uses, where baseline CII GPCD equals the average for any contiguous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.
 - c. Estimated per capita landscape water use for landscape irrigated through residential and dedicated irrigation meters assuming water use efficiency equivalent to the standards of the Model Water Efficient Landscape Ordinance set forth in Section 2.7 of Division 2 of Title 23 of the California Code of Regulations.
- 3. Set the 2020 target to 95 percent of the applicable state hydrologic region target, as set forth in the state's draft 20x2020 Water Conservation Plan (dated April 30, 2009).
- 4. A method determined by DWR through the urban stakeholder process.

For district-specific SBx7-7 compliance, targets were set to either 80 percent of baseline gpcd (Method 1) or 95 percent of the District's hydrologic region target (Method 3), whichever was greater. An analysis for Method 2 was not performed due to a lack of data necessary for this method. Method 4 was also not considered because it was not available when the Conservation Master Plan process began.

Under Method 1, the 2015 and 2020 targets are set to 90 percent and 80 percent of baseline water use, respectively. Baseline water use is the average water use for any continuous 10-year period ending between 2004 and 2010. For the Dominguez District, the 10-year base period 1999-2008 yielded the maximum target under this method. The 2015 target is 193 gpcd and a 2020 target is 171 gpcd. Table 3.3-9 summarizes the base period ranges and Table 3.3-10 lists the per capita demand over this 10-year base period.

	Table 3.3-9: Base	Period Ranges (Table 13)	
Base	Parameter	Value	Units
	2008 total water deliveries	43,160	AF
	2008 total volume of delivered recycled water	4,918	AF
10-15-year base period	2008 recycled water use as a percent of total deliveries	11	%
	Number of years in base period	10	years
	Year beginning base period range	1999	
	Number of years in base period Year beginning	2008	
	Number of years in base period	5	years
5-year base period	Year beginning base period range	2003	
	Year ending base period range	2007	

Tal	Table 3.3-10: Daily Base Per Capita Water Use-10-Year Range (Table 14)									
Base Per	Base Period Year		Daily System Gross	Annual Daily Per						
Sequence Year	Calendar Year	Distribution System Population	Water Use (mgd)	Capita Water Use (gpcd)						
Year 1	1999	138,750	28.15	203						
Year 2	2000	139,558	28.66	205						
Year 3	2001	140,230	29.06	207						
Year 4	2002	140,480	30.96	220						
Year 5	2003	140,500	32.15	229						
Year 6	2004	141,610	33.39	236						
Year 7	2005	142,420	31.71	223						
Year 8	2006	142,770	31.95	224						
Year 9	2007	142,810	29.56	207						
Year 10	2008	143,360	26.83	187						
		Base Daily I	Per Capita Water Use	214						

Under Method 3, the 2015 and 2020 targets are set to 95 percent of the 2015 and 2020 targets for the hydrologic region in which the district is located. Because the Dominguez District is located in the South Coast hydrologic region the Dominguez District's 2015 target is 157 gpcd and the 2020 target is 142 gpcd.

The SBx7-7 target for 2020 cannot exceed 95 percent of the District's five-year baseline water use, where the baseline period ends no earlier than December 31, 2007 and no later than December 31, 2010. The District's 2020 target cannot exceed this level, regardless of which method is used to calculate it. The maximum allowable target in the Dominguez District is 212 gpcd, as shown in Table 3.3-11. In this case, neither target calculation method results in a target exceeding the maximum allowable target, so no adjustment is necessary.

Table 3.3-11: Daily Base Per Capita Water Use-5-Year Range (Table 15)										
Base Period Year		Distribution	Daily System Gross	Annual Daily Per						
Sequence Year	Calendar Year	System Population Water Use (mge		Capita Water Use (gpcd)						
Year 1	2003	140,500	32.15	229						
Year 2	2004	141,610	33.39	236						
Year 3	2005	142,420	31.71	223

3.3.2 Low Income Housing Projected Demands

California Senate Bill No. 1087 (SB 1087), Chapter 727, was passed in 2005 and amended Government Code Section 65589.7 and Water Code Section 10631.1. SB 1087 requires local governments to provide a copy of their adopted housing element to water and sewer providers. In addition, it requires water providers to grant priority for service allocations to proposed developments that include housing units for lower income families and workers. Subsequent revisions to the Urban Water Management Planning Act require water providers to develop water demand projections for lower income single and multi-family households.

Cal Water does not maintain records of the income level of its customers and does not discriminate in terms of supplying water to any development. Cal Water is required to serve any development that occurs within its service area, regardless of the targeted income level of the future residents. It is ultimately the City's or County's responsibility to approve or not approve developments within the service area.

For the purposes of estimating projected demand for low income households, Cal Water examined the Housing Elements from the cities that make up the Dominguez District. The City of Carson estimates that 21.7 percent of the households are in the lowest income category. The City of Torrance estimates that 6.6 percent of the households are in the lowest income category. Data for the Cities of West Carson and Long Beach were not readily available. The portion of unincorporated Los Angeles County served by Cal Water is quite small. For these reasons, Cal Water assumed that they had similar percentages of low income households.

An aggregate of the above referenced percentages, or 14.2 percent, was used to estimate projected demand for low income households in the Dominguez Districts.

Table 3.3-13: Low-income Projected Water Demands (Table 8)										
Low Income Water Demands	2015	2020	2025	2030	2035	2040				
Single-family residential	1,463	1,295	1,275	1,252	1,227	1,200				
Multi-family residential	381	336	330	323	315	307				
Total	1,844	1,631	1,605	1,575	1,542	1,507				

As a benefit to our customers, Cal Water offers its Low Income Rate Assistance Program (LIRA) in all of its service districts. Under the LIRA Program qualified customers are able to receive a discount on their monthly bills.

⁴ "City of Torrance, General Plan - Housing Element", City of Torrance, August 24, 2010, Page H-14

3.4 Total Water Use

Cal Water does not currently sell water to other agencies, nor does it provide water directly for saline barriers, groundwater recharge, or conjunctive use. The potential additional water uses within Cal Water's service area were discussed and quantified in Section 4. For the purposes of this UWMP it is assumed that the only potable water sales to customers, recycled water, and distribution system losses are included in the total demand.

Tabl	Table 3.4-1: Additional Water Uses and Losses - AFY (Table 9 and 10)									
Water Use	2010	2015	2020	2025	2030	2035	2040			
Sales to Other Agencies	-	ı	1	1	1	-	-			
Saline barriers	-	1	-	-	-	-	-			
Groundwater recharge	-	-	-	-	-	-	-			
Conjunctive use	-	-	-	-	-	-	-			
Raw water	-	1	-	-	-	-	-			
Recycled	5,251	4,134	4,586	5,088	5,646	6,264	6,950			
Unaccounted- for system losses	4,045	2,243	1,987	1,957	1,923	1,886	1,845			
Total	9,296	6,376	6,573	7,045	7,568	8,149	8,795			

Actual and projected water use through 2040 is shown in Table 3.4-2. The values represent the total target demand projection based on SBx7-7 gpcd targets, including recycled water and unaccounted for water.

Table 3.4-2: Total Water Use – Actual and Projected AFY (Table 11)									
	2005 2010 2015 2020 2025 2030 2035						2035	2040	
Water Use	40,319	42,566	39,362	36,802	37,915	39,094	40,344	41,677	

Figure 3.4-1 shows the planned sources of supply based on these demands through 2040.

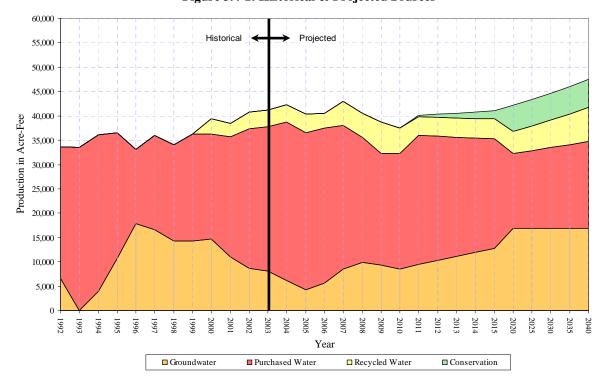

Figure 3.4-1: Historical & Projected Sources

4 System Supplies

4.1 Introduction

The water supply served to the customers of the Dominguez District is a combination of the following sources:

- Groundwater pumped from two adjudicated groundwater basins the West Coast Basin and the Central Basin. Groundwater is extracted from both basins using 11 wells (9 active and 2 inactive).
- Imported water purchased from Metropolitan Water District of Southern California through the West Basin Municipal Water District.
- Cal Water purchases treated desalted brackish groundwater produced in the C. Marvin Brewer Desalter owned by West Basin Municipal Water District.
- Recycled wastewater produced by the West Basin Municipal Water District in their West Basin Water Recycling Plant located in El Segundo.

Groundwater generally supplies approximately 25 percent of the annual demand. Purchased water from WBMWD satisfies about 65 percent of the District's water demand, and recycled water makes up the remaining 10 percent. The distribution of water sources for 2010 is shown in Figure 4.1-1.

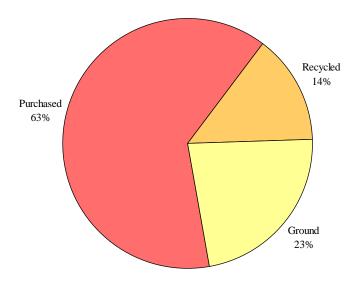

Figure 4.1-1: Water Supply by Source for 2010

The projected water supply sources and volumes are summarized in Table 4.1-1. Cal Water plans on maximizing the groundwater source and will construct new wells until it has sufficient capacity to annually and reliably pump its adjudicated right. Cal Water currently leases out a portion of its groundwater rights using short term transfer agreements. The leased amounts are not available to Cal Water during the length of the agreement. The amount of recycled water listed is the projected demand from this source. Imported water will be used to provide the remaining supply.

Table 4.1-1: Available Water Supplies (Table 16) (AFY)									
Water Supply Sources	2010 Actual	2015	2020	2025	2030	2035	2040		
West Basin Municipal Water District – Purchased Water	23,645	22,492	15,319	15,930	16,551	17,183	17,831

Desalination	-	-	-	-	-	-	-		
Total	37,471	39,362	36,802	37,915	39,094	40,344	41,677		

4.2 Imported Water

Imported water is delivered through seven WBMWD service connections from four MWD distribution feeders - the Palos Verdes Feeder, Victoria Feeder, Long Beach Lateral and Extension and the Sepulveda Feeder. The total rated capacity of the seven service connections is 72,000 gpm. If operated at full capacity these connections could deliver 103.68 mgd (116,140 AFY).

MWD classifications of service and rate structure have gone under considerable change in recent years. Key to the changes is the establishment of Purchase Agreements for imported water provided by WBMWD. This agreement establishes several important new concepts with respect to water sales within MWD's service area, see Appendix J. The agreement sets a Base Allocation for each Purchaser, which is essentially their share of the supply MWD has made available to the WBMWD. The Base Allocation was based on that Purchaser's five year average non-surplus purchases during fiscal years ending 1997 through 2001. Over the term of the agreement, the Purchaser commits to purchase at least the amount of 60 percent of the Base Allocation times five, which is known as the Purchase Commitment. If a Purchaser does not purchase during the term of the agreement, the full Purchase Commitment, then they must pay for the balance at the average Tier 1 Supply Rate.

A two-tier rate and annual allocation is another aspect of these agreements. The agreement sets a Tier 1 Annual Maximum at 90 percent of the Base Allocation. All water purchased in any year in an amount that is equal to or less than the Tier 1 Maximum will be purchased at the Tier 1 Rate. Any amount of water purchase in excess of the Tier 1 Annual Maximum will be sold at the Tier 2 Rate.

In the Imported Water Purchase agreement for Cal Water with the WBMWD, the Base, Tier Allocations, and Purchase Commitment are established as a combined allocation of all four Cal Water Districts. Under this, the Dominguez District shares in the combined allocations with the three other California Water Service districts. The agreement was initially adopted to be effective on January 1, 2003; a later amendment became effective January 1, 2008. The amended agreement adjusted Cal Water's Tier 1 Annual Maximum to 70,000 acre-feet and the Purchase Commitment to 210,000 acre-feet. Cal Water has developed an allocation that distributes the Tier 1 Annual Maximum to each of its four districts, so that if the total Tier 1 Maximum is exceeded the applicable Tier 2 charges can be assessed to the appropriate district. The allocations are as follows: Dominguez 22,400 AF, Hawthorne 4,900 AF, Hermosa-Redondo 16,800 AF, and Palos Verdes 25,900.

In-Lieu Seasonal Storage currently remains a valid economic incentive program, but purchases of this class of water do not count toward the Purchase Commitment. Shift Seasonal Storage and Emergency service classifications were eliminated. Seasonal Storage Service is a classification for water that is available for delivery during the winter (October through April) in years of adequate supply. Monthly certification is required to receive this reduced-price Seasonal Storage Service.

To qualify for In-Lieu Seasonal Storage Service water rates, a purveyor must reduce the demand for supplemental water from MWD in the summer months (May to September) and shift production of groundwater from winter to summer. The baseline production ratio between local groundwater supply and total demand verifies that this shift has been accomplished. Under the In-Lieu classification the groundwater not pumped is left in the ground in order to augment groundwater replenishment efforts.

This program benefits MWD by reducing the summer peak flows that were beginning to tax MWD's treatment facilities and distribution system, and enables MWD to maximize water importation during the winter when surplus flows are abundant in the areas of origin.

Table 4.2-1: Demand projections provided to wholesale suppliers – AFY (Table 17)										
Wholesaler	2010	2015	2020	2025	2030	2035	2040			
West Basin Municipal Water District-Imported	23,645	22,492	15,319	15,930	16,551	17,183	17,831			
West Basin Municipal Water District-Recycled	5,251	4,134	4,586	5,088	5,646	6,264	6,950			
Total Wholesale Supply	26,626	19,905	21,018	22,197	23,447	24,780	26,626			

The projected demand to be supplied by WBMWD is shown in Table 4.2-1.

4.3 Surface Water

Cal Water does not have any local surface water within the Dominguez District. However, surface water is the source for the imported water, which is transported through the Colorado River Aqueduct system and from Northern California through the State Water Project.

4.4 Groundwater

In 1965 the Central Coast Basin was adjudicated, and in 1961 the West Coast Sub-basin was adjudicated, with the Department of Water Resources as Watermaster. The adjudication orders are attached as Appendices J and K for each basin, respectively. The Department of Water Resources Annual Summary of Watermaster Service reports on groundwater status in each of the basins. This summary includes historical fluctuation of water level elevation in wells throughout the basin. These references indicate that, since the reduction in pumping began in 1954 and the adjudication was implemented in 1961, groundwater levels in the West Coast Basin have risen some 20 to 60 feet, depending on location. However, many groundwater elevations in the basin remain below sea level, requiring the maintenance of seawater intrusion barriers.

The West Coast basin is a pressurized aquifer groundwater basin with three primary aguifers: the 200-foot Sands, the Silverado Aguifer, and the Lower San Pedro Aguifer. These aguifers have continuity with the Pacific Ocean in Santa Monica Bay. Overdraft of the basin was caused by excessive pumping due to population growth and rapid industrialization of the Los Angeles Coastal Plain beginning in the 1930s. This overdraft caused lowering of the piezometric head of the aquifers, which increased pumping cost and resulted in seawater intrusion. The adjudication of the West Coast Basin began in 1945 when Cal Water, along with the City if Torrance and the Palos Verdes Water Company filed a lawsuit in Superior Court, Los Angeles County, to quiet title to the groundwater rights and control pumping in the basin. As part of the effort to resolve the overdraft condition, the West Basin Municipal Water District was formed in 1947 to distribute supplemental water to the major water purveyors imported into the region by the Metropolitan Water District of Southern California (MWD). In 1955 when pumpers realized the severity of the overdraft, groundwater pumping was limited under an interim agreement. In 1961, the Court rescinded the interim agreement and signed the West Coast Basin Judgment.

The Dominguez Water Company was identified as a party to the judgment and granted water rights. Now Cal Water, as a result of the merger with Dominguez, owns 10,417.45 acre-feet of adjudicated rights in the West Coast Basin, or 16.15 percent of the total basin annual adjudicated rights of 64,486.25 acre-feet. This amount is in addition to the 4,070 acre-feet held by Cal Water's Hermosa-Redondo District. As a result of the reduction in pumping ordered by the adjudication and increased recharge via the injection wells of the seawater intrusion barrier, in-lieu replenishment and improved underflow from Central Basin, the water levels in the West Coast Basin have slowly recovered to near 1940 levels.

The adjudication of the Central Basin began not out of litigation as in the West Coast Basin, but out of the collective concern expressed by the major pumpers regarding the impacts that reduced groundwater quantity and quality would have on the future of their communities. The Central Basin Municipal Water District was formed in 1952 to distribute supplemental water to the major water purveyors. In 1954 it was annexed to the MWD, so that access to the imported water supplies was available to the region.

The Water Replenishment District was created in 1959, largely out of cooperation between the West Coast Basin Water Association and the Central Basin Water Association, with the directive to facilitate artificial replenishment of the two basins as a means of eliminating the overdraft and halting seawater intrusion. To quiet the title to and limit production of the groundwater in Central Basin the Replenishment District filed a lawsuit in Superior Court, Los Angeles in 1962 against more than 700 parties. Later that year after a vast majority of the pumpers approved of the approach, the Court adopted an interim agreement to limit the production from the basin. In 1965, following extensive meetings by the parties to work out a settlement, that was supported by pumpers representing over 75 percent of the basins anticipated water rights, the court approved the stipulated judgment for the Central Basin.

This judgment established an adjudicated water right for each party, Table 4.4-1, but limited the allowable pumping allocation (APA) to 80 percent of the water right, which equals 217,367 acre-feet annually. The Dominguez Water Company was identified as a party to the judgment and granted water rights. As a result of the merger with Dominguez, Cal Water now owns 8,100 acre-feet of adjudicated right with the associated 6,480 AFY of APA in the Central Basin. This amount is in addition to the 11,774 acrefeet held by Cal Water's East Los Angeles District.

Table 4.4-1: Groundwater Pumping Rights (AFY)						
Basin Name	Pumping Right - AFY					
Central Basin	6,480.00					
West Coast Basin	10,417.45					
Total	16,897.45					

The principle mechanisms for recharge in the West Coast Basin are the injection of water into the seawater intrusion barriers, in-lieu replenishment, and inflow to the West Coast Basin from the Central Basin. The Central Basin is recharged through percolation of water applied to surface spreading ponds in the Montebello Forebay, in-lieu replenishment, and inflow to the Central Basin from the San Gabriel Valley.

The Los Angeles County Department of Public Works owns and operates all groundwater recharge facilities as a county funded activity through a longstanding inter-agency agreement. As a result, the costs associated with the capture and recharge of storm runoff water is not directly accountable in the cost of water replenishment. All other water used for replenishing the groundwater of the Central and West Coast Basins is funded by the WRDSC through the Replenishment Assessment. Additionally, the WRDSC manages various groundwater quality cleanup programs. To finance its designated responsibilities the WRDSC levies a Replenishment Assessment on every acre-foot of groundwater produced in the Central and West Coast Basins.

Cal Water's operational plan in the Dominguez District is to manage the District's water supplies in an effort to coordinate with existing regional conjunctive-use programs, and to take advantage of economic incentives and the lease market to the fullest extent possible. Because the carry-over amount fluctuates, annual allowable extractions vary.

The historical volume of the groundwater pumped is shown in Table 4.4-2 and the projected volume is presented in Table 4.4-3. Cal Water plans on increasing its well capacity to meet these needs and will need to evaluate the feasibility of maintaining its short term lease agreements.

Table 4.4-2: Amount of Groundwater Pumped – AFY (Table 18)									
Basin Name	2006	2007	2008	2009	2010				
Central and West Basins	5,612	8,552	9,869	9,398	8,575				
% of Total Water Supply	14%	20%	24%	24%	23%				

Table 4.4-3: Amount of Groundwater projected to be pumped – AFY (Table 19)										
Basin Name	2015	2020	2025	2030	2035	2040				
Central and West Basins	12,736	16,897	16,897	16,897	16,897	16,897				
% of Total Water Supply	31%	40%	39%	38%	37%	36%				

4.4.1 Basin Boundaries and Hydrology

The West Coast Subbasin is bounded on the north by the Ballona Escarpment, an abandoned erosional channel from the Los Angeles River. On the east it is bounded by the Newport-Inglewood fault zone and on the south and west by the Pacific Ocean and consolidated rocks of the Palos Verdes Hills. The surface of the sub-basin is crossed in the south by the Los Angeles River through the Dominguez Gap, and the San Gabriel River through the Alamitos Gap, both of which then flow into San Pedro Bay.

The Central Subbasin occupies a large portion of the southeastern part of the Coastal Plain of Los Angeles Groundwater Basin. This subbasin is bounded on the north by a surface divide called the La Brea High, and on the northeast and east by emergent less permeable Tertiary rocks of the Elysian, Repetto, Merced and Puente Hills. The southeast boundary between Central Basin and Orange County Groundwater Basin roughly follows Coyote Creek, which is a regional drainage province boundary. The southwest boundary is formed by the Newport Inglewood fault system and the associated folded rocks of the Newport Inglewood uplift. The Los Angeles and San Gabriel Rivers drain inland basins and pass across the surface of the Central Basin on their way to the Pacific Ocean Bay.

A detail description of the basin is given in the California's Ground Water Bulletin 118, see Appendix D. Urban Water Management Plans for West Coast Basin and Central Basin are included in Appendix H and I, respectively.

4.4.2 Groundwater Management Plan

As the regional groundwater management agency for two of the most utilized groundwater basins in the state of California, the WRD plays an integral role in overall water resource management in southern Los Angeles County. The WRD manages groundwater for nearly four million residents in 43 cities of southern Los Angeles

County. The 420 square mile service area uses about 250,000 acre-feet of groundwater per year, which equates to nearly 40 percent of the total demand for water. The WRD ensures that a reliable supply of high quality groundwater is available through its clean water projects, water supply programs, and effective management principles. A copy of the 2003 WRD Strategic Plan is included as Appendix J.

4.4.3 Desalted Brackish Groundwater

Seawater intrusion has been a problem in the West Coast Basin since the 1930s. Two seawater intrusion barriers, the West Coast Basin Barrier and the Dominguez Gap Barrier, have addressed the threat of losing the basin to salt water. The Los Angeles County Department of Public Works operates both barriers and the Water Replenishment District buys the water used in these facilities from WBMWD. Seawater intrusion has been effectively halted at the barrier alignment; however, a large body of brackish water still lies inland of the barrier. This saline plume is a result of seawater intrusion that occurred prior to operation of the barrier and is being addressed through desalination using reverse osmosis facilities at the C. Marvin Brewer Desalter, a demonstration project started in July of 1993.

Dominguez Water Corporation, with the support of the WBMWD, the Water Replenishment District of Southern California, Metropolitan Water District of Southern California, and the United States Bureau of Reclamation, established the C. Marvin Brewer Desalter. The goal was to demonstrate that this plume could be extracted, treated, and put to beneficial use in an economical manner. That cost is further reduced through an incentive program offered by MWD, known as the Local Projects Program, so that the unit cost to the customer is slightly less than non-interruptible imported service from MWD. Following the merger of Cal Water and Dominguez Water Corporation in 2000, Cal Water has operated this desalinization facility.

4.5 Recycled Water

The WBMWD has constructed what will ultimately be one of the largest water reuse projects in the United States. In the Phase I User Report, HYA Consulting Engineers identified over 105 economically feasible recycled water users with a combined estimated average annual demand of 19,100 AF. The project, when fully constructed, has the potential to deliver nearly 70,000 AF of tertiary treated recycled water per year. Following treatment at the Hyperion Water Treatment Plant, which is owned by the city of Los Angeles and located near the Los Angeles airport, recycled water is being used for injection at the seawater intrusion barriers, for industrial operations and for landscape irrigation. Cal Water Dominguez began purchasing recycled water from the WBMWD in 2000. The use of recycled water will likely increase over time as new customers are added, the distribution system is expanded, and the amount of potable supply is stretched thin as cities in the area grow.

4.5.1 Wastewater Collection

The Los Angeles County Sanitation Districts (LACSD) own, operate, and maintain the sewer system consisting of gravity sewers, pumping stations, and force mains to collect

wastewater from Dominguez service area. The collected wastewater is discharged to trunk sewers and interceptors owned and operated by the LACSD. The wastewater is conveyed to the LACSD's Joint Water Pollution Control Plant in Carson, where it receives secondary treatment prior to discharge in an ocean outfall. Although this plant does not currently produce recycled water, it is being considered as a potential source of recycled water in the future.

4.5.2 Estimated Wastewater Generated

Estimates of future wastewater flows are presented in Table 4.5-1. The estimates for total wastewater were calculated by using 90 percent of the January water use totals for the residential and commercial sectors in Cal Water's service area, and extrapolating to 2040 using a linear projection of the historical data, as shown in Figure 4.5-1.

Table 4.5-1: Recycled Water Wastewater Collected and Treated-AFY (Table 21)								
Type of Wastewater Treatment Level 2010 2015 2020 2025 2030 2035 2040							2040	
Total Collected and Treated	Secondary	18,042	18,320	18,603	18,890	19,192	19,479	19,780

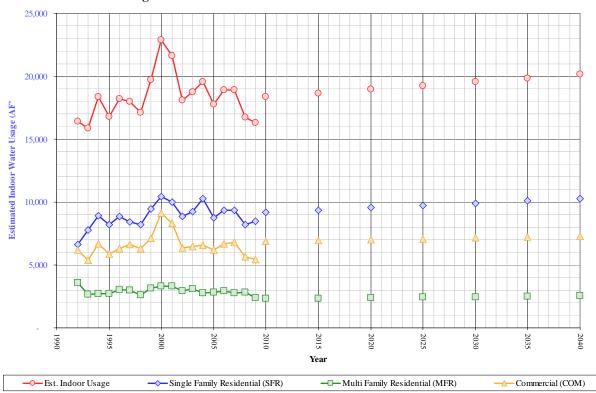

Figure 4.5-1: Estimated District Annual Wastewater Generated

4.5.3 Wastewater Treatment and Recycling

Although the LACSD's Joint Water Pollution Control Plant provides the wastewater service for the Dominguez service area, recycled water is provided to the Dominguez service area by the West Basin Water Recycling Facility (WBWRF). The source of the recycled water is treated effluent from the city of Los Angeles' Hyperion Wastewater Treatment Plant. The Hyperion Wastewater Treatment Plant provides secondary treatment using the activated sludge process. Most of the treated effluent is disposed of through an ocean outfall, but approximately 6 percent of the treated effluent is sent to the West Basin Water Recycling Facility in El Segundo where it undergoes chemical clarification, recarbonation, microfiltration, and chlorination. The WBWRF produces about 42,000 AFY (37.5 mgd) of recycled water and has an ultimate capacity of 67,210 AF/Y (60 mgd).

Recycled water from the WBWRF is used for several purposes: 1) groundwater replenishment through more than injection 100 wells, 2) landscape irrigation and 3) industrial process water. The WBWRF serves more than 140 sites including areas in Manhattan Beach, Torrance, Hermosa Beach, Carson, and Inglewood.

The Joint Water Pollution Control Plant is the largest of the LACSD's wastewater treatment plants. It provides advanced primary and partial secondary treatment for 350 million gallons of wastewater per day and serves a population of approximately 3.5 million people. The treated wastewater is disinfected with chlorine and sent to the Pacific Ocean through a network of outfalls that extend two miles off the Palos Verdes Peninsula to a depth of 200 feet.

WBMWD is responsible for:

- Determining the technical and economic feasibility of supplying recycled water to the Dominguez service area
- Encouraging the use of and optimizing the use of recycled water in the Dominguez service area
- Extension of recycled water lines within the Dominguez service area

Cal Water encourages the use of recycled water by offering the recycled water at a reduced cost.

4.5.4 Potential Water Recycling

The WBMWD Water Recycling Master Plan identified potential customers in Cal Water's Dominguez service area. Currently eleven services utilize recycled water. The plan had anticipated that the commercial, industrial and irrigation customers would increase to 158 services by 2007. The estimated total average demand projected for Dominguez customers is 10,800 acre-feet per year. The Water Recycling Program involves several projects to install pipelines capable of delivering recycled water throughout the Harbor/South Bay area as shown see Figure 4.5-2.

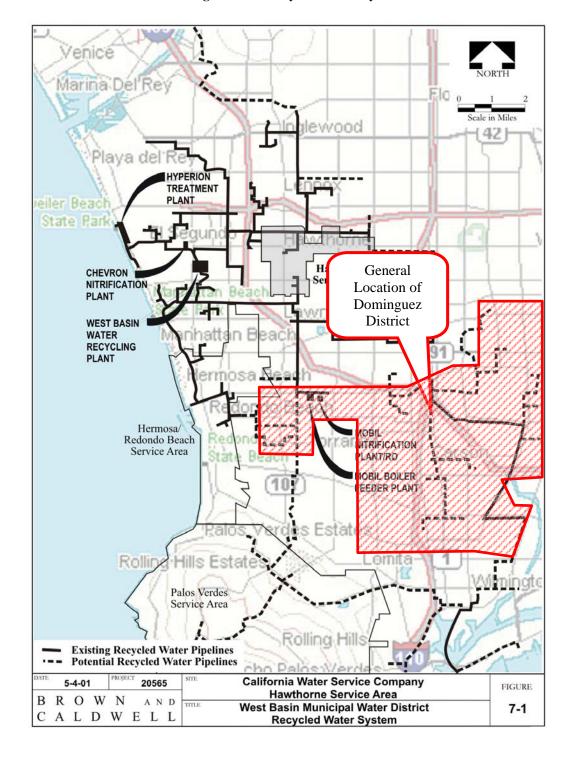

Figure 4.5-2: Recycled Water System

The estimates given in the Water Recycling Master Plan are very ambitious when compared to the past recycled water usage record for the District. The Water Recycling Master Plan relies heavily on several large water users taking recycled water in-lieu of pumping groundwater using water rights held independent of Cal Water, at a cost nearly double the cost of groundwater pumping. Another concern with this estimate is that it anticipated large uses of recycled water by several customers for industrial processes currently unproven for the use of recycled water. For the purposes of this planning document Cal Water has kept the projected use of recycled water at the low end of WBMWD's estimated recycled water sales projection. Cal Water projects the sale of recycled water to reach 6,950 acre-feet by 2040. As the actual recycled water use pattern within the District develops, Cal Water's forecast for the District will be adjusted.

Table 4.5-2 summarizes the projected recycled water supply in Cal Water's Dominguez service area through the year 2040. For this exercise Cal Water assumes that industrial use of recycled water will account for 80 percent of the total recycled water use, and landscape irrigation will make up the remaining 20 percent.

Table 4.5-2: Recycled Water - Potential Future Use-AFY (Table 23)								
User Type	User Type Description Feasibility 2015 2020 2025 2030 2035 20							2040
Industrial	Refinery	Yes	3,307	3,669	4,070	4,517	5,011	5,560
Landscape irrigation	Landscape irrigation Parks, Schools, etc.		827	917	1,018	1,129	1,253	1,390
		4,134	4,586	5,088	5,646	6,264	6,950	

Cal Water's Water Supply and Facilities Master Plan (WSFMP) for the Dominguez District identified potential customers for recycled water with a total demand of 5.94 MGD. The general location and potential demands are shown in Figure 4.5-3.

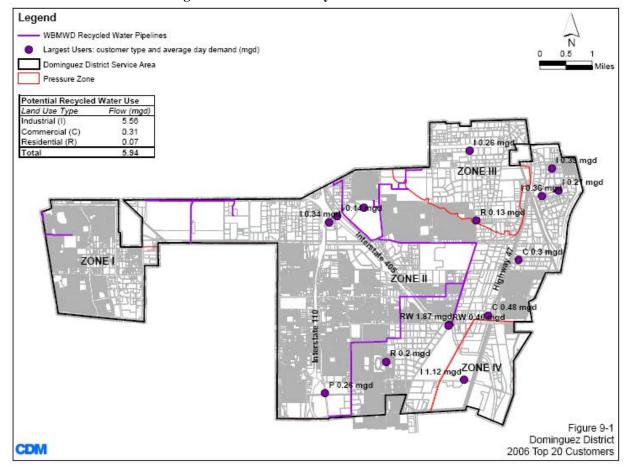

Figure 4.5-3: Potential Recycled Water Customers

4.6 Desalinated Water

The Dominguez District's location adjacent to Cal Water's Hermosa Redondo District, which is on the coast, makes it a good candidate for the use of desalinated water, if it was warranted. A desalination facility could be located in the Hermosa-Redondo service area and could be used to supply water to other Cal Water Districts. Desalination would provide an increase in reliability of overall supplies in the area. In the future Cal Water may perform a feasibility study to determine if desalinated water could become an alternative supply.

In June 2005, West Basin was awarded approximately \$1.7 million for its desalination program by the California Department of Water Resources under Proposition 50. The goal of West Basin's Temporary Ocean-Water Desalination Demonstration Project is to conduct research and develop data for the permitting, design, construction, and operation

of West Basin's proposed full-scale desalination facility. In contrast to the Pilot Project, West Basin's Demonstration Facility will utilize limited quantities of full-scale equipment to refine operating parameters, perform additional water quality testing, evaluate source intake methodologies, and assess energy efficiency. West Basin's temporary Demonstration project will be constructed in, and adjacent to, an existing pump house at the L.A. Conservation Corps' SEA Lab facility in Redondo Beach.

If the Pilot Project is successful and West Basin proceeds to build a large scale desalination plant in this location, Cal Water will have access to this alternative supply.

4.7 Transfer or Exchange Opportunities

The lease or purchase of additional Adjudicated Water Rights could be utilized to achieve increased supply reliability and availability. Obtaining additional adjudicated rights would further increase the savings available to the District by reducing the amount of purchased water. However, at this time the District does not have sufficient production capacity to fully utilize all of its existing adjudicated right under this program. Cal Water maintains several short term leases with local municipalities and private companies for the right to use this excess groundwater supply. As more wells are constructed in Dominguez, Cal Water will be able to produce a larger portion of its adjudicated right.

4.8 Future Water Supply Projects

The viability of future supplies is contingent upon how these supplies influence or are affected by several critical conditions. These conditions include operational feasibility and reliability, supply reliability, economic incentive, economic effect on customers, and regional supply ramifications.

For an alternative water strategy to be acceptable, it must be feasible from an operational perspective, and add to the overall reliability of the distribution system. Development of alternate supply sources can affect the amounts of money spent to purchase water, and provide greater reliability during periods of supply shortages. However, the cost of constructing the facilities to provide this additional capacity also increases as more facilities are constructed, and, at some point, the revenue requirements to finance this construction exceed the savings generated by the added source capacity.

One of the Cal Water's objectives is to provide sufficient redundant facilities such that adequate supply and delivery capacities are maintained and available.

The reliability of MWD imported water supplies has deteriorated in recent years. Because of this deterioration in supply reliability, MWD has implemented several programs that provide the following:

• Financial incentives for development of local supplies

- Use of imported supplies on a seasonal basis and in a manner that maximizes the importation of supplies into Southern California
- Storage for surplus imported supplies for future use
- Restore usability to contaminated local groundwater

Cal Water regularly reviews and comments on the proposed water rates of the regional water supply and management agencies. Cal Water was instrumental in developing and promoting the in-lieu replenishment concept in the 1960's, and today is striving through its work with the three regional water agencies to improve these programs in order to maintain the economic incentives and regional supply benefits that this program provides.

Any program that modifies the operational strategy of the District, or requires the installation of addition facilities to enhance supply reliability, must, prior to being implemented, be evaluated to determine what impacts that project will have on various regional supply conditions. These conditions are interrelated and impacting one will affect the others. These conditions are:

- The West Coast and Central Basin are an adjudicated groundwater basins
- ♦ The existence of the seawater intrusion barriers
- ♦ The West Basin Municipal Water District Reclamation program
- The basin overdraft that caused declining groundwater levels
- More frequent shortages of available imported water supplies

4.8.1 Water Supply Alternatives

Cal Water regularly considers alternate water supply strategies for the Dominguez District. The alternatives are compared against projected water rates for MWD, WBMWD and WRDSC and the estimated fixed capital costs along with projected annual operation and maintenance costs. Cal Water conducted a detailed water supply alternative analysis as part of the Water Supply and Facility Master Plan scheduled in 2009. Water supply alternatives to be considered include but are not limited any of the following.

4.8.2 Continuation of Existing Supply

The existing supply facilities and operations are adequate to provide for projected demand through the year 2040. However, they are structured to place a high degree of reliance on the continued availability of imported water. While it is recognized that MWD will continue its efforts to provide a reliable and affordable imported water supply, it is also recognized that, as the demand for water increases, the frequency of shortages will also increase. Therefore, it will become increasingly more important to enhance and develop facilities that shift reliance toward the use of local supplies. MWD and WBMWD have established an objective to provide 100 percent reliability over the next twenty years in meeting all non-discounted, non-interruptible, demand in the region. MWD has undertaken a number of planning initiatives to ensure this reliability. Among

them, include the Integrated Resource Plan (IRP), the Water Surplus and Drought Management Plan (WS&DMP) and their Local Resource Investments.

4.8.3 Groundwater Expansion

As discussed previously, the well production capacity of the operating wells is below the adjudicated water rights held by the Dominguez District. To increase production two new wells will need to be developed and the existing wells would have to operate almost ninety percent of the time. Under ideal conditions, it may be reasonable to rely on this, but conditions in the Dominguez District are not always ideal. The mineralization of groundwater due to the proximity of the saline plume and the extended periods of well inactivity has resulted in problems with regard to secondary water quality standards. Cal Water is addressing these problems with treatment.

Cal Water plans to develop new wells in the District as new well sites can be located and demand conditions dictate. This additional capacity will facilitate greater participation in the economic incentive programs and enable the District to over-extract groundwater during authorized supply shortages. The recent problems with secondary water quality standards will require Cal Water to install treatment on existing and potentially on any new well facility.

4.8.4 Brackish Water Recovery

Desalinization of brackish groundwater is an alternative that typically uses the membrane desalting technology known as reverse osmosis. Because the concentration of salts in this process is often substantially less than that of seawater, the cost per acre-foot to produce this water supply is also much less. As noted earlier, the Dominguez Desalinization Demonstration Project, also known as the C. Marvin Brewer Desalter, is producing potable water from brackish groundwater produced from the Silverado aquifer at a cost of \$660 per acre-foot.

Projects that recover contaminated groundwater in a manner that improves water supply reliability for municipal and domestic uses can be submitted to Metropolitan Water District for financial assistance under their Groundwater Recovery Program. To qualify, a project must have total costs in excess of MWD's Non-Interruptible water rate and the project must produce a new supply of water rather than simply improve the quality of an existing supply. Qualifying projects are provided a maximum financial subsidy of \$250 per acre-foot of water produced that is put to use in MWD's service area. This aid can be used for the repayment of capital debt financed by the project owner.

The C. Marvin Brewer Desalter was able to qualify for assistance under this program because the Dominguez Water Corporation was fully utilizing all of its adjudicated rights without needing the two saline contaminated wells used in the project. To assure that this water could be considered a "new" supply, an amendment to the West Coast Basin Judgment exempted the groundwater extracted for the demonstration project from being counted under the terms of the Judgment.

It would be more difficult to accommodate the "new" water requirement of the GRP Program for wells that gradually become contaminated from the saline plume. The affected wells would have to be replaced with wells that were free of contaminants and a similar modification to the Judgment would be needed to avoid over-extraction of the basin.

4.8.5 Seawater Barrier

Two injection barriers have been created and are being maintained by the water supplier to stop the inflow of seawater into the West Coast Basin. This project is outside of the Dominguez District boundary and Cal Water does not supply any water to this project.

Water Supply Reliability and Water Shortage Contingency Planning

5.1 Water Supply Reliability

The water supply for the Dominguez District is ultimately reliant on annual precipitation in the watersheds of the Feather and Colorado Rivers that supply the main aqueducts in Southern California. Local weather has less of an effect on annual supplies. However, it has a large impact on customer demands. In dry years demand tends to increase as natural precipitation is replaced by potable supply for uses such as outdoor landscape irrigation. As dry conditions persist, demands tend to decrease over time as customers respond to drought conditions and conservation messaging. A comparison of annual rainfall and customer demand since 1992 is shown in Figure 5.1-1. These trends are expected to repeat during future drought events.

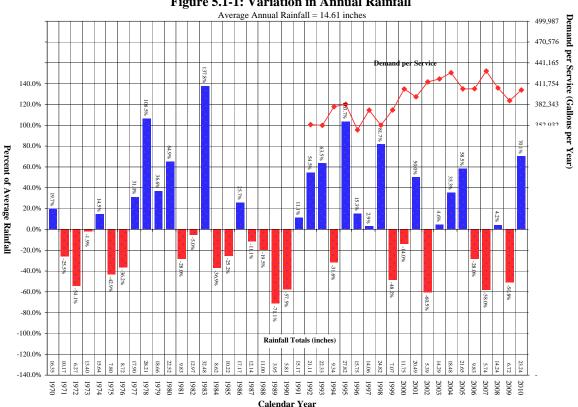

Figure 5.1-1: Variation in Annual Rainfall

Because of the merger with the Dominguez Water Company, historical data for the District has been limited from 1992 to the present. Determining the water supply reliability is limited to this time frame.

5.2 Drought Planning

The most recent driest year occurred in 2002 when the rainfall was 60 percent below average (5.39 inches). This is taken as the single dry year shown in the following table. The multiple dry years used in the following table are based on the most recent and consecutive lowest annual rainfall totals which occurred from 2006 to 2009. The normal year is taken as 2003, when the annual rainfall was approximately equal to the average rainfall totals. The base years are summarized in Table 5.2-1.

Table 5.2-1: Basis of Water Year Data (Table 27)						
Water Year Type	Base Year (s)					
Average Water Year	2003					
Single-Dry Water Year	2002					
Multiple-Dry Water Years	2006-2009					

Cal Water is not a regional water wholesaler and does not store water seasonally in reservoirs or other storage facilities. Therefore total runoff figures can not be used to determine supply reliability. Perhaps a better indication of annual variability would be the variation in customer demand between normal and single dry or multiple dry years. This can be seen in the overall average demand per service values for the District, as shown in Table 5.2-2. The data suggests a typical pattern where demand increases at the beginning of the drought and is gradually reduced as dry conditions persist. This reduction generally happens as a result of increased conservation requests by water providers and a general awareness of the problem by customers.

Table 5.2-2 shows the water supplies used in the normal, single dry, and multiple dry years described above. As a result of dry conditions and decreased storage, in 2008 MWD entered into Stage 2 of its Water Supply Allocation Plan, resulting in approximately 10 percent reduction in imported water allocations. Cal Water customers responded by reducing demand to meet these allocation targets. For the reasons described above, demand totals have been substituted for supply amounts in this analysis. If customers were not able to meet the reduction target, demand would increase, and penalty rates could be applied to these additional Cal Water purchases.

Table 5.2-2: Supply Reliability – gal/service/yr (Table 28)							
Awaraga	Single Duy	Multiple Dry Water Years					
Average / Normal Water Year	Single Dry Water Year	Year 1	Year 2	Year 3	Year 4		
418,428	414,244	404,500	429,545	405,628	387,758		
% of Normal	99%	97%	103%	97%	93%		

The supply reliability analysis reflects the assertion that the combination of the safe yield of groundwater in conjunction with MWD's available drought year supplies will be sufficient to provide the normal allotment of water to Cal Water's Dominguez District even in times of prolonged drought. For this analysis it is assumed that the current agreement for purchased water with WBMWD will be renewed and that normal amounts of recycled water will be available in all years.

Table 5.2-3 shows an estimate of the minimum water supply for the next three years. In this case 2010 was assumed to be a normal year and the supply for 2011-2013 will be reduced by the percentages listed in Table 5.2-2 for the multiple dry years. Groundwater and recycled water are drought proof supplies and will be available in their normal amounts in all years. The groundwater quantities shown in the table reflect Cal Water's expecting pumping capacity in these years. Cal Water intends to increase well capacity until the full adjudicated right can be utilized on an annual basis. The recycled water quantities shown are the expected demands from this source. Imported water will be used to make up the remaining supply and will vary according to customer demand.

Table 5.2-3: Supply Reliability – Current Water Sources - AFY (Table 31)								
T	Average /	Multiple Dry Water Year Water Supply						
Water Supply Source	Normal Water Year Water Supply	2011	2012	2013				
Purchased	28,086	25,392	26,520	23,457				
Recycled	3,462	3,804	3,884	3,965				
Groundwater	8,099	9,407	10,239	11,071				
Total	39,647	38,603	40,643	38,493				
Percent of Normal Year	100%	97%	103%	97%				

5.2.1 Normal-Year Comparison

Water supply and demand patterns change during normal, single dry, and multi dry years. To analyze these changes, Cal Water relies on historical usage to document expected changes in future usage in water demand; such as, assuming increasing demand due to increased irrigation needs or a decrease in demand due to awareness of drought conditions.

The groundwater supply is available in all hydrologic year types and is limited to Cal Water's APA. Cal Water intends to maximize this source by 2020 by increasing well capacity. The current short term lease agreements would need to be terminated so that the full APA could be realized. The recycled supply shown in Table 5.2-4 is the expected demand from this source and will be available in all hydrologic years.

The remaining supply will come from purchased water, which will vary depending on customer demand. The combined projected purchased water for all Cal Water's districts receiving water from WBMWD will be below the Tier I maximum of 70,000 AFY in normal hydrologic years.

According to MWD's 2010 Regional Urban Water Management Plan, sufficient supplies of imported water will be available in normal hydrologic years to meet all projected demands. For this analysis the normal demand is considered equal to the SBx7-7 target water demand projection plus recycled water use. Table 5.2-4 indicates that supplies will be reliable throughout the planning horizon of this UWMP and that no supply deficiencies are expected.

Table 5.2-4: Supply and Demand Comparison - Normal Year - AF (Table 32)								
	2015	2020	2025	2030	2035	2040		
Purchased water	22,492	15,319	15,930	16,551	17,183	17,831		
Groundwater	12,736	16,897	16,897	16,897	16,897	16,897		
Recycled water	4,134	4,586	5,088	5,646	6,264	6,950

Difference as % of Supply	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%		
Difference as % of Demand	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%		

5.2.2 Single Dry-Year Comparison

In general, and from operational records, the District's demand has shown to increase during a single-dry years as compared to normal years. The water demand increases due to maintenance of landscape and other high water uses that would normally be supplied by precipitation. The demand values shown in Table 5.2-5 were calculated by increasing the target demand projection in each year by the percentage listed for the single dry year in Table 5.2-2. Again, Cal Water assumes that the total supply available will equal the demand in all future years.

As noted in the previous section, groundwater and recycled water are expected to be available in normal amounts during all hydrologic years. And purchased water will provide the balance of supply to meet customer demands. The combined projected purchased water for Cal Water's districts receiving water from WBMWD will be below the Tier I maximum of 70,000 AFY in single dry hydrologic years. According to MWD's 2010 Regional Urban Water Management Plan, sufficient supplies of imported water will be available in single dry years to meet all projected demands. MWD asserts that the policies provided in the 2010 IRP update will insure this reliability. Therefore, the supply is 100 percent reliable in single dry years.

Table 5.2-5: Supply and Demand Comparison - Single Dry Year - AF (Table 33) (Table 32)								
	2015	2020	2025	2030	2035	2040		
Purchased water	22,099	14,951	15,551	16,160	16,780	17,414		
Groundwater	12,736	16,897	16,897	16,897	16,897	16,897		
Recycled water	4,134	4,586	5,088	5,646	6,264	6,950		
Supply totals	38,968	36,434	37,536	38,703	39,941	41,260		
Demand totals	38,968	36,434	37,536	38,703	39,941	41,260		
Difference	0	0	0	0	0	0		
Difference as % of Supply	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%		
Difference as % of Demand	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%		

5.2.3 Multiple Dry-Year Comparison

As noted earlier, water demand generally increases early in a multiple dry year period then gradually decreases as the drought persists and customers respond to conservation messaging. This pattern is evident in Table 5.2-6 where demands at the beginning of each five year period are higher than in the normal year scenario, and demands decrease each year thereafter. The supplies and demands shown here are calculated by multiplying the target demand projection for that year by the percentages listed in Table 5.2-2 for the multiple dry year period, including recycled water.

Groundwater and recycled water are expected to be available in normal amounts during all hydrologic years. Purchased water will provide the balance of supply to meet customer demands. The combined projected purchased water for all Cal Water's districts receiving water from WBMWD will be below the Tier I maximum of 70,000 AFY in multiple-dry hydrologic years. According to MWD's 2010 Regional Urban Water Management Plan, sufficient supplies of imported water will be available in multi dry years to meet all projected demands. MWD asserts that the policies provided in the 2010 IRP update will insure this reliability. Therefore, Cal Water expects the supply to be 100 percent reliable in single dry years. Again, no supply deficiency is expected.

Using the recent drought from 2006-2009 as an example, Cal Water expects MWD to begin its Water Supply Allocation Plan during future dry year periods. Although not reflected in the table below, reductions in demand will likely be necessary as the drought persists. As was seen over the last three years, Cal Water's customers have been able to respond and meet these target demand allocations.

Table 5.2-6: Su	ipply And Dem	and Compari	ison - Multip	le Dry Year l	Events – AFY	(Table 34)

5.3 Factors Affecting Reliability of Supply

Although the historical record shows that demand can be met by the supply, several factors that influence the reliability of each source are listed in Table 5.3-1.

Table 5.3-1: Factors Resulting In Inconsistency of Supply (Table 10)							
Name of supply Legal Environ- Water mental Quality Climatic							
West Basin Municipal Water District Purchased Water	✓	✓		✓			
Groundwater		✓	✓	✓			

Although unlikely, any change to current agreements with WBMWD or WRDSC could negatively affect the future availability of supply. As discussed earlier the recent Wanger Decision limits the ability of the SWP and CVP to pump water from the Delta during critical supply times due to threatened fish species. At this time it is not known how long these restrictions will be in place or if other fish species will be protected under similar decisions. But environmental concerns such as these could result in a permanent reduction of available imported water supplies.

Before the Wanger Decision restrictions went into effect, short-term drought events were not thought to pose a serious threat to the reliability of supply in the Dominguez District. The buffer of excess imported supplies will not exist as long as Delta pumping is reduced. This decreases the reliability of supply for the Dominguez District. During drought events Cal Water may have to implement voluntary or mandatory rationing depending on the severity of the drought and availability of imported supplies. During extended droughts, as the primary source of supply shifts from WBMWD deliveries to groundwater withdrawals, and the reliability of supply would decrease as the drought event continued.

According to planning documents such as West Basin's Draft 2010 Urban Water Management Plan and MWD's Updated Integrated Resource Plan (IRP), Cal Water could expect 100 percent reliability of supply even in multiple year droughts through 2035. However, given the Delta pumping restrictions and the lengthening drought in the Colorado River watershed, this level of reliability is in question.

Over time, water conservation and the use of recycled water will offset a portion of future potable demands. Also, during dry years as deliveries from the Colorado River Aqueduct and the SWP are reduced, MWD will draw water from other storage areas established through groundwater banking and transfer agreements made with other agencies. These agreements are further described in MWD's Water Surplus and Drought Management Plan (WSDM Plan).

5.4 Water Quality

The drinking water delivered in the Dominguez District, whether its source is groundwater or imported water, meets or surpasses all federal and state regulations. All drinking water standards are set by the U.S. Environmental Protection Agency under the authorization of the Federal Safe Drinking Water Act of 1974. In California, the state's Department of Public Health can either adopt the USEPA standard or set state standards that are more stringent than those set by the federal government.

There are two types of drinking water standards: Primary and Secondary. Primary Standards are designed to protect public health by establishing Maximum Contamination Levels (MCL) for substances in water that may be harmful to humans or affect their health. MCLs are established conservatively for each contaminant, and are generally based on health effects that may occur if a person were to drink two liters of the water per day for 70 years. Secondary Standards are based on the aesthetic qualities of the water, such as taste, odor, color, and certain mineral content. These standards, established by the State of California, specify limits for substances that may affect consumer acceptance of the water.

The Dominguez water system is served by a combination of groundwater wells and treated surface water purchased from MWD. Three of MWD's treatment plants currently have ozone treatment. The remaining two treatment plants are currently under construction for ozone treatment. MWD has been fluoridating the water since October 2007. In MWD's 2010 Regional Urban Water Management Plan, their water quality concerns are salinity, perchlorate, TOC/bromide, nutrients (algae), arsenic, uranium, hexavalent chromium, NDMA, and PPCP (pharmaceuticals and personal care products).

The quality of the groundwater produced by the district's currently nine active wells tends to have constituents that may lead to DBP precursors or secondary MCLs. The reactivation of another groundwater water well is expected to be online by early 2011. The Dominguez groundwater wells typically contains TOC, methane, hydrogen sulfide, organic color and naturally occurring ammonia. There will be wellhead treatment added in the near future to reduce DBP precursors and control taste and odor. All of the groundwater wells are disinfected with chlorine and ammonia to form chloramines. Since this water system is disinfected with chloramines, nitrification is a possibility that is constantly monitored in the distribution system and in storage tanks.

The surrounding Dominguez water system has quite a few groundwater contaminants from either refineries, past underground oil storage tanks, or illegal discharges. Cal Water is working with Environmental Protection Agency (EPA), Regional Water Quality Control Board (RWQCB) and Department of Toxic Substances Control (DTSC) to monitor the contaminant plumes, predominately volatile organic constituents (VOCs).

5.5 Water Shortage Contingency Plan

This section contains an updated version of Cal Water's Water Shortage Contingency Plan. The Water Shortage Contingency Plan was last revised in response to the drought that California experienced between 1987 and 1992. The first version of the Plan was included in each subsequent UWMP update.

California's most recent drought event that began in the spring of 2006, coupled with the Delta pumping restrictions, brought increased awareness to the importance of drought preparedness. By the spring of 2008 it became apparent that several of Cal Water's service districts had the potential for water supply shortages and potential wholesaler allocations in the following year. In response, a Conservation/Supply Team was formed to develop a plan for addressing these potential issues. Through this process Cal Water learned valuable lessons and is better prepared for extended droughts or other long term water shortages. The results of this planning process are summarized in this Water Shortage Contingency Plan.

5.5.1 Water Shortage Contingency Plan Scope

The Water Shortage Contingency Plan is a unique document designed to address specific conditions that may occur from time to time in Cal Water's service areas. It can be triggered by several types of events but is primarily used as a response to longer term drought conditions. The Water Shortage Contingency Plan provides a comprehensive company-wide strategy for approaching water supply shortages that may last from several months to several years in duration.

Other triggers may include a partial loss of supply due to a mechanical failure of either Cal Water or wholesale supplier facilities resulting from natural disasters, chemical contamination, or other water quality issues. These two types of triggers are unlikely in larger districts where operational changes can more easily be made in one part of the system to overcome supply shortages in other parts of the system. However, in smaller isolated systems that rely heavily on one source of supply, a partial loss of this supply could necessitate the implementation of the Water Shortage Contingency Plan. Generally, this type of water supply shortage would not last as long as those caused by drought.

There are some important distinctions that should be made between the Water Shortage Contingency Plan and other programs and plans that Cal Water has for each district. Cal Water also maintains an Emergency Response Plan (ERP) for each service area. The ERP is similar to the Water Shortage Contingency Plan in that it may include a loss of supply and inability to serve our customers with normal quantities of water. However, the ERP is designed to manage crises that occur more suddenly and are caused by events such as natural disasters, technological failures, chemical contamination, or national security emergencies.

The ERP provides a guide for district and general office personnel to follow in response to one of these emergencies. It includes the policies, responsibilities, and procedures to

be used to protect public safety and includes the setup of an Emergency Operations Center and implementation of the Standardized Emergency Management System. The ERP also describes the necessary inter-jurisdictional coordination and provides the communications and notification plan to insure an efficient response to the emergency.

The ERP for each district was completed in 2004 in response to the Public Health and Safety and Bioterrorism and Response Preparedness Act (H.R. 3448) of 2002. They were then updated in May of 2008. Cal Water is planning to rewrite the ERPs in the next few years. These new Plans will include more detailed district-specific information and will be designed to be used as a manual for Cal Water personnel during emergency situations.

Cal Water is also in the process of developing Water Conservation Master Plans for each district. These Water Conservation Master Plans are different from the Water Shortage Contingency Plans in that they are designed to permanently reduce per capita water use by Cal Water's customers. The Water Conservation Master Plans are not associated with any short or long term loss of supply but will have the effect of making existing supplies last further into the future. In the short term, this will also provide increased supply reliability.

The water use targets selected by Cal Water for each service area are consistent with current regulations. In general, this will mean a reduction in per capita demand. Specific reductions will vary by service area and are contained in the service-area specific Water Conservation Master Plans. The annual level of funding for these programs will be determined through each General Rate Case filed with the California Public Utilities Commission (CPUC). The Water Conservation Master Plan will be discussed in more detail in Section 5 of this UWMP.

5.5.2 Water Conservation/Water Supply Team

As mentioned earlier, Cal Water formed a Conservation/Supply Team in response to the water shortage conditions that were forecasted for 2009. This Team consisted of an interdepartmental group of personnel that guided the planning process for the company-wide response to the drought. Members of the Conservation/Supply Team include:

- Vice President of Regulatory and Corporate Communications
- Vice President of Customer Service, Human Resources, and Information Technology
- Director of Corporate Communications
- Director of Customer Service
- Conservation Manager
- Chief Engineer
- Water Resources Planning Supervisor
- Manager of Rates
- Manager of Operations

- Maintenance Manager
- Billing Manager
- Regulatory Accounting Manager
- Meter Operations Supervisor
- Support Staff

The Conservation/Supply Team held regular meetings to discuss strategies for all aspects of drought preparation such as water supply monitoring, public communications, wholesale and customer allocations, information technology improvements, and financial impacts. Additional staff participated as needed as the planning process progressed.

5.5.3 Water Supply Allocation Plan

During the most recent drought several of Cal Water's districts were faced with the possibility of reduced wholesale allocations of imported water. If implemented, Cal Water would need to reduce its use of this supply proportionally in order to meet regional conservation targets and avoid wholesaler imposed penalties for overuse. Cal Water would have to request customers to reduce water use, usually to the same level as required by the wholesaler.

These reductions could either be voluntary or mandatory depending on the severity of the cutback required. If mandatory rationing is deemed necessary, retail customer allocations would need to be implemented. To determine the methodology used for customer allocations a cross-functional Water Allocation Team was formed. The Water Allocation Team consisted of a subset of the Conservation/Supply Team and was tasked with developing the details of how the allocation process would be handled internally by Cal Water. The Water Allocation Team reported back to the Conservation/Supply Team at the regular meetings.

The Water Allocation Team meetings resulted in a comprehensive strategy that is summarized in Cal Water's Water Supply Allocation Plan. The Water Supply Allocation Plan details the methodology used for determining customer allocations, conducting public communications, tracking water use, assessing penalties, and processing appeals.

The Water Supply Allocation Plan also outlines regulatory actions that must be taken in order to implement mandatory allocations. If it is determined that mandatory allocations are likely to be necessary in a particular district Cal Water will file a Tier 2 advice letter with the CPUC that describes the need for mandatory allocations as well as our methodology and plan for implementation. A public hearing is required during the 30 days following this filing and all customers in the affected district will be notified of the hearing. If, after the 30 day period, it is determined that mandatory allocations are necessary, Cal Water will file a Tier 1 advice letter with the CPUC, which would make mandatory allocations effective 5 days following the filing.

Cal Water has the legal authority to implement mandatory allocations only after requesting from the CPUC that Tariff Rule 14.1, Mandatory Conservation Plan, be added to existing tariffs. *Section A. Conservation – Nonessential or Unauthorized Water Use* of Tariff Rule 14.1 identifies specific water use prohibitions. Prior to implementing mandatory allocations Cal Water will communicate details of the Plan to all customers.

5.5.4 Allocation Methodology and Customer Information

The Water Allocation Team's methodology for determining customer allocations was decided through careful consideration of all available information. Throughout this process the Team tried to maintain fairness to all customers and develop a plan that was easy to understand and communicate. Secondary concerns included impacts to Cal Water such as the ease of implementation and revenue shortfalls.

Customer allocations will be calculated on a monthly basis for each "premise", or customer location. The required cutback will be a percent reduction from prior use compared to baseline time period. The percentage reduction and baseline that Cal Water uses will be consistent with those used by the regional wholesaler. This will be done to ensure regional coordination between agencies and to offer a clear message to the public. In districts that do not have an imported supply and therefore no wholesaler, Cal Water will choose the percent reduction depending on the severity of the water shortage.

In most cases the percent reduction will be kept constant on an annual basis. It will be reviewed and adjusted as necessary in the spring of each year after the water supply picture becomes clear for the following dry season. In most districts Cal Water does not have direct control over long term storage of imported water and will rely on the California Department of Water Resources, U.S. Bureau of Reclamation, and regional water wholesalers to manage carryover storage between years. In some cases it may be necessary to adjust these percentages mid-year, if, for example, a district is not meeting its reduction target. The allocation period will end when Cal Water determines that the water shortage no longer exists and ample supplies are available on an ongoing basis.

A minimum allocation will be given to single-family residential customers whose monthly allocation would fall below a level that is considered necessary for health and safety. These minimum allocations will be calculated for each district and will include water for indoor consumption on a per capita basis and also a percentage of normal water for outdoor use such as landscape irrigation. Multi-family, commercial, industrial, government, and other service connection categories will not be subject to minimum allocations.

Cal Water will provide customers the opportunity to bank unused water that has been allocated in a billing period. A customer will bank their unused allocation in a given billing period which can then be used to offset a future month where the customer exceeds their allocation. There is no limit to the amount of water that can be banked by a

customer. All banked water will expire once allocations are determined to no longer be needed.

As a deterrent to exceeding monthly allocations and to offset penalties that Cal Water may incur from wholesale agencies, a penalty rate will be applied to a customer's water use that is in excess of their allocation. This penalty rate will be charged in addition to the normal tiered rate for every unit (Ccf) above the allocation during a billing period.

If a customer feels that their allocation does not represent their current need, or to dispute penalties assessed to their account, customers can file an appeal with their local district. The appropriate personnel will review the appeal and issue a judgment in writing. The appeals will be reviewed according to rules outlined in the Water Supply Allocation Plan.

During a water shortage priority will be given to uses that promote public health and safety. These uses include residential indoor use and other sanitary purposes. On a case by case basis Cal Water will decide that certain services are seen as essential, such as hospitals, and may exempt the customer from allocations. The second priority will be given to commercial and industrial water use in an effort to minimize financial impacts to local businesses. And finally, outdoor irrigation has the lowest priority.

If Cal Water requests voluntary reductions, all customer categories will be asked to make the same percent reduction. If mandatory reductions are required, which in general means a reduction of greater than 15 percent, Cal Water may develop different demand reduction targets for each connection category. This will be done to enforce the priorities listed above and to ensure that the correct mix of targets are chosen so that the overall district demand reduction goal is reached.

5.5.5 Drought Stages

Cal Water has developed a four stage approach to drought response that corresponds to specific levels of water supply shortage. At each higher stage Cal Water will become more aggressive in requiring water use reductions from its customers. The decision to enter a new stage will be made by careful consideration of a variety of factors including wholesale supply, availability of alternative supplies, time of year, and regional coordinated activities. These stages are designed to guide Cal Water personnel in making informed decisions during water shortages. A certain amount of flexibility is built in to the stages to allow for the unique characteristics of each water shortage event and the unique characteristics within each of Cal Water's districts. In each progressive stage the actions taken in earlier stages will be carried through to the next stage either at the same or at an increased intensity level, thereby becoming more restrictive.

When the water conditions in a district appear to warrant the activation of the Shortage Contingency Plan's Demand Reduction Stages, whether that be via implementing <u>Stage</u> 1, the movement from one Stage to a higher stage, the movement from a higher stage back down to a lower stage, or deactivating the use of Demand Reduction Stages

altogether; the Water Conservation /Water Supply Team will consider those conditions at hand and prepare a recommendation on the appropriate action to be taken by the Company. The Team's recommendation will be presented by the Chief Engineer to the Vice President of Engineering and Water Quality. If the Vice President of Engineering and Water Quality concurs with the WC/WS Team recommendation, then he or she will take that recommendation to the President and Chief Executive Officer. The President & CEO will make the final determination as to whether or not the recommended action is to be taken by the Company.

If it is determined that the Company will implement or change the active Demand Reduction Stage for a given District, then a press release will be made in a manner that advises the customers served by that district of this determination. This press release will explain the desired outcome of the action to implement the appropriate stage. Upon making that determination Cal Water will immediately begin implementing the specific actions identified for the determined stage as outlined in the reminder of this section of the Shortage Contingency plan.

<u>Stage 1</u> covers water shortages of up to 10 percent and can be used to address annual variations in precipitation and mild drought events that may last only a year or two. All reductions in Stage 1 are voluntary and impacts to customers are minimal. The actions to be taken by Cal Water in Stage 1 are listed in Table 5.5-1.

Table 5.5-1: Demand Reduction Stage 1 (Table 36)			
Stage	Water Supplier Actions		
1. Minimal	Cal Water will:		
5 to 10 percent Shortage	Request voluntary customer conservation as described in CPUC Rule 14.1.		
Up to 10	Maintain an ongoing public information campaign.		
percent Reduction	Maintain conservation kit distribution programs.		
Goal	Maintain school education programs.		
Voluntary Reductions	Maintain incentive programs for high efficiency devices.		
	Coordinate drought response with wholesale suppliers and cities.		
	Lobby cities for passage of drought ordinances.		
	Discontinue system flushing except for water quality purposes.		
	Request that restaurants serve water only on request.		

<u>Stage 2</u> includes water shortages of between 10 and 20 percent. <u>Stage 2</u> will be entered during prolonged water shortages of moderate severity such as those caused by a multi-year drought. Reduction methods can either be voluntary or mandatory depending on the severity of the water shortage. Allocations would likely be implemented when the shortage exceeds 15 percent. Customers will begin to notice moderate impacts to normal water use and companies may begin to have financial impacts. In <u>Stage 2</u> Cal Water will intensify its conservation efforts by implementing the actions listed in Table 5.5-2.

Table 5.5-2: Demand Reduction Stage 2 (Table 36)			
Stage	Water Supplier Actions		
2. Moderate	Cal Water will:		
10 to 20 Percent	Increase or continue all actions from Stage 1.		
Shortage	Implement communication plan with customers, cities, and wholesale suppliers.		
Up to 20 Percent Reduction	Request voluntary or mandatory customer reductions.		
Goal	File Schedule 14.1 with CPUC approval if necessary.		
Voluntary or Mandatory Reductions	Request memorandum account to track penalty rate proceeds and other drought related expenses.		
reductions	Lobby for implementation of drought ordinances.		
	Monitor water use for compliance with reduction targets.		

<u>Stage 3</u> represents a severe water shortage emergency with a reduction in supply of between 20 and 35 percent. This stage can be triggered by the most severe multi-year droughts, major failures in water production and distribution facilities, or by water quality concerns, especially in smaller isolated systems. A shortage of this magnitude may begin to seriously impact public health and safety, and cause significant financial hardships on local businesses. All reductions will be mandatory and customer allocations would be necessary. During <u>Stage 3</u> Cal Water will take the following actions listed in Table 5.5-3, which includes all the actions from Stage 2.

Table 5.5-3: Demand Reduction Stage 3 (Table 36)			
Stage	Water Supplier Actions		
3. Severe	Cal Water will:		
20 to 35 Percent	Increase or continue all actions from previous stages.		
Shortage	Implement mandatory conservation with CPUC approval.		
Up to 35 Percent	Install flow restrictors on repeat offenders.		
Reduction Goal	Require customers to have high efficiency devices before granting increased allocations.		
Mandatory Reductions	Require participation in survey before granting an increased allocation.		

<u>Stage 4</u> is a critical water shortage emergency with a reduction of supply of at least 35 and potentially above 50 percent. This represents an exceptional crisis that could be caused only by the most severe multi-year drought, natural disaster, or catastrophic failure of major water supply infrastructure. Impacts to public health and safety would be significant. In <u>Stage 4</u> Cal Water will take the additional actions listed in Table 5.5-4 while also continuing or increasing actions from Stage 3.

Table 5.5-4: Demand Reduction Stage 4 (Table 36)			
Stage	Water Supplier Actions		
4. Critical	Cal Water will:		
35 to 50+ Percent	Increase or continue all actions from previous stages.		
Shortage	Discontinue service for repeat offenders.		
Up to and above a 50	Monitor water use weekly for compliance with reduction targets.		
percent Reduction Goal	Prohibit potable water use for landscape irrigation.		
Mandatory Reductions			

5.5.6 Water Supply Conditions and Trigger Levels

As described in Section 4, the water supply for the Dominguez District is a mix of groundwater, imported water and recycled water. Cal Water's groundwater supply from both Central and West Basins is limited to its APA of 16,897 AF. This value is based on the safe yield of each basin and is fixed in both wet and drought years. Once the full pumping capacity is restored, a portion of this groundwater supply could be used to offset any reductions in imported water deliveries. Another contingency option during dry years would be to make the decision not to renew short term leases, which would make more groundwater available to Cal Water if it is faced with wholesale allocations.

The recycled supply comes through WBMWD. The Dominguez District began serving recycled water to its customers in 2000 and now delivers approximately 4,000 AFY. Recycled water offers a drought proof supply that is available in all years and would not be subject to allocations from WBMWD. During a water shortage Cal Water can make an effort to maximize recycled water deliveries to replace potable water demand.

Cal Water's imported supply for the Dominguez District comes through the West Basin Municipal Water District (WBMWD), which is a member agency of the Metropolitan

Water District of Southern California (MWD). Cal Water's Water Shortage Allocation Plan will ultimately be triggered by actions within these agencies. Although Cal Water could decide to increase groundwater pumping to make up the difference in demand, except in unusual circumstances it will follow the lead of these agencies when deciding whether to implement the Water Shortage Allocation Plan. The percent shortage identified by MWD will determine which drought stage Cal Water enters into. These thresholds are shown in Table 5.5-5.

Table 5.5-5: Water Supply Triggering Levels (Table 35)			
Stage	Percent Shortage		
Stage 1	5 to 10% supply reduction		
Stage 2	10 to 20% supply reduction		
Stage 3	20 to 35% supply reduction		
Stage 4	35 to 50% supply reduction		

In April of each year, after the winter storm season, MWD will assess its available water supply and decide if it will request voluntary of mandatory reductions by its member agencies. MWD will judge the performance of WBMWD retailers as a whole and will only assess penalties to WBMWD if the retailers' collective use exceeds its allocation. These reduction targets will be passed along through WBMWD to Cal Water and from Cal Water to our customers. If necessary, the allocation period will begin on July 1st of the given year and will continue at least one year or until the availability of supplies warrants the lifting of water use restrictions.

Cal Water's timeline for implementing its Water Shortage Contingency Plan will generally follow MWD's schedule. However, Cal Water will monitor water supply conditions throughout the year and will independently assess the threat of water shortage conditions. This will allow Cal Water to make the necessary preparations prior to the high water use season when restrictions would likely go into effect. Preparations may include filing the appropriate advice letters with the CPUC, hiring additional staff, training existing staff, making billing system improvements, developing public communications material, making operational changes, and performing maintenance to the water system facilities. This advanced planning will minimize the potential lag time between when a water shortage is declared and when restrictions can take effect. The reduction in lag time is essential in order to maximize the water savings during the high use summer months.

5.5.7 Water Use Restriction Enforcement

Because of its investor owned status Cal Water has limited authority to enforce water use restrictions unless Rule 14.1 is enacted through CPUC approval. Restrictions on water use prior to enacting Rule 14.1 must be regulated by ordinances passed by the local governments in each community served. Cal Water has worked with municipalities to pass ordinances and will continue this effort on an ongoing basis. Rule 14.1 contains a

detailed list of the water use restrictions common to many of these ordinances, and is included as Appendix E of this UWMP.

In the Dominguez District the cities of Carson and Torrance have passed water conservation ordinances. They are included in Appendix E.

Cal Water maintains extensive water use records on individual metered customer accounts. These records are reviewed in the districts to identify potential water loss problems. In order to protect itself against serious and unnecessary waste or misuse of water, Cal Water may meter any flat rate service and apply the regularly established meter rates where the customer continues to misuse or waste water beyond five days after Cal Water has given the customer written notice to remedy such practices.

During all stages of water shortages, production figures are reported to and monitored by the district manager. Consumption will be monitored through these daily production figures in the district for compliance with necessary reductions.

Cal Water, after one written warning, shall install a flow-restricting device on the service line of any customer observed by Cal Water personnel to be using water for any non-essential or unauthorized use defined in Section A. of Tariff Rule 14.1. Repeated violations of unauthorized water use will result in discontinuance of water service.

5.5.8 Analysis of Revenue and Expenditure Impacts

Cal Water is an investor-owned water utility and, as such, is regulated by the CPUC. On March 8, 1989, the Commission instituted an investigation to determine what actions should be taken to mitigate the effects of water shortages on the State's regulated utilities and their customers. In decision D. 90-07-067, effective July 18, 1990, the Commission authorized all utilities to establish memorandum accounts to track expenses and revenue shortfalls caused both by mandatory rationing and by voluntary conservation efforts. Subsequently, D. 90-08-55 required each class A utility (more than 10,000 connections) seeking to recover revenues from a drought memorandum account to submit; for Commission approval, a water management program that addresses long-term strategies for reducing water consumption. Utilities with approved water management programs were authorized to implement a surcharge to recover revenue shortfalls recorded in their drought memorandum accounts.

However, the Commission's Decision 94-02-043 dated February 16, 1994, states:

- 10. Now that the drought is over, there is no need to track losses in sales due to residual conservation.
- 11. The procedures governing voluntary conservation memorandum accounts (see D.92-09-084) developed in this Drought Investigation will no longer be available to water companies as of the date of this order.
- 12. Procedures and remedies developed in the Drought Investigation that are not specifically authorized for use in the event of future drought in these Ordering Paragraphs will no longer be available to water companies as of the date of this order except upon filing and approval of a formal application.

(CPUC Decision 94-02-043, Findings of Fact, paragraphs 10-12)

In 2008 the CPUC allowed for the creation of a Water Revenue Adjustment Mechanism (WRAM) and Modified Cost Balancing Accounts (MCBA). The goals of the WRAM and MCBA are to sever the relationship between sales and revenue to remove the disincentive to implement conservation rates and conservation programs especially in times of drought. WRAM and MCBA are designed to ensure that the utilities and ratepayers are proportionally affected when conservation rates are implemented, so that neither party is harmed nor benefits. Because of these regulatory developments Cal Water expects to increase the implementation of conservation rates and conservation programs on a permanent basis.

During water supply shortages Cal Water would expect to see a reduction in revenue. The amount of this reduction would depend on the total amount of water being conserved and the price (tier rate) at which the cutbacks were made for each customer. In other words, the reduction would be roughly equivalent to the quantity charge for the amount of water saved. Cal Water would still receive its monthly service charge fees.

Cal Water has adequate reserves to overcome this short term reduction. These reductions in revenue would also be recovered through the WRAM and MCBA. Through the WRAM and MCBA Cal Water will be able to track its revenue impacts and expenditures during water shortages and recover these losses through the CPUC rate case process in future years. Because of these new mechanisms Cal Water is assured that it will have adequate reserves available to operate normally under water shortage conditions.

Expenditures will not increase due to a mild water shortage condition. Any expenditure made during this time will come out of the normal conservation budget that has been approved by the CPUC. Actions that may be taken include public information campaigns that draw attention to the shortage and steer customers towards our other conservation programs (toilet rebates, washing machine rebates, home audits, etc) that are available. These programs will be paid for by money that is already budgeted. Therefore no additional expenditures will take place. If the water shortage warrants mandatory allocations, Cal Water would need to file an advice letter with the CPUC to seek approval to implement mandatory allocations. This process would include securing any additional

funding necessary for the administration of this program. Again, these costs would be recovered through the MCBA and WRAM.

5.5.9 Catastrophic Water Supply Interruption

As mentioned earlier, Cal Water has an ERP in place that coordinates the overall company response to a disaster in any or all of its districts. In addition, the ERP requires each District to have a local disaster plan that coordinates emergency responses with other agencies in the area.

Cal Water also inspects its facilities annually for earthquake safety. To prevent loss of these facilities during an earthquake, auxiliary generators and improvements to the water storage facilities have been installed as part of Cal Water's annual budgeting and improvement process.

During an actual or threatened temporary shortage of imported water to the West Basin, the WRDSC is authorized by the West Coast Basin Judgment to enter into agreements with water purveyors in the basin, which allow the over-extraction of groundwater. This authorized over-extraction can last for four months and may be used to produce a maximum of 10,000 acre-feet. Such agreements are not subject to the "make-up" provisions of the Judgment. If the shortage continues beyond four months, further over-extraction would require court approval. The normal production capacity of the Dominguez wells would enable participation in this emergency supply. However, given the current short-term limitation on well capacity, the District would not be in the position to participate in any authorized over-extraction program. As a result, the District's customers will be exposed to the full effect of a shortage until Cal Water can rehabilitate the inoperative wells.

There are ten interconnections in the Dominguez District, five of which are for emergency exchanges of water and five are for routine operational exchanges of water. Of the emergency interconnections: one is with the City of Compton, one with Southern California Water Company, one with the City of Torrance and two are with Cal Water's Hermosa-Redondo District. All emergency interconnections are non-metered, two-way connections. Of the operational interconnections; four are metered one-way connections with Cal Water's Hermosa-Redondo District that enable water to be delivered to the Dominguez system. The final operational interconnection is with Southern California Water Company. This is a temporary metered connection to supply a portion of Southern California Water Company's service area until they are able to restore inoperative supply facilities. Once Southern California Water has upgraded their system, the meter will be removed and this interconnection will be placed in emergency use status.

6 Demand Management Measures

6.1 Statewide Urban Water Demand Reduction Policies

As mentioned earlier, Cal Water is in the process of significantly expanding its conservation programs. Inter-related state-level policies and agreements aimed at reducing urban water use have provided much of the impetus for this change. The policies include: (1) recent decisions by the California Public Utilities Commission (CPUC) directing Class A and B water utilities to reduce per capita urban water demand; (2) state legislation mandating urban water suppliers to reduce per capita demand 20 percent by 2020; and (3) the Memorandum of Understanding Regarding Urban Water Conservation in California (MOU). This section discusses these requirements, their relationship to one another, and their relationship to Cal Water's overall conservation strategy.

The CPUC's Decision 07-05-062 directed Class A and B water utilities to submit a plan to achieve a 5 percent reduction in average customer water use over each three-year rate cycle. This policy was refined under Decision 08-02-036, which established a water use reduction goal of 3 to 6 percent in per customer or service connection consumption every three years once a full conservation program, with price and non-price components, is in place. These decisions anticipated enactment of policies by the State legislature to reduce urban water use in California 20 percent by 2020.

SBx7-7 requires the state to achieve a 20 percent reduction in urban per capita water use by December 31, 2020. The state is required to make incremental progress toward this goal by reducing per capita water use by at least 10 percent on or before December 31, 2015. SBx7-7 requires each urban retail water supplier to develop interim and 2020 urban water use targets. Urban retail water suppliers will not be eligible for state water grants or loans unless they comply with SBx7-7's requirements.

There are three ways in which a water supplier can comply with the MOU. The first way is to implement a set of water conservation best management practices (BMPs) according to the requirements and schedules set forth in Exhibit 1 of the MOU. The second way, called Flex Track compliance, is to implement conservation programs expected to save an equivalent or greater volume of water than the BMPs. The third way, similar to SBx7-7, is to reduce per capita water use. Each of these compliance options is briefly described below.

Originally, the MOU established a set of BMPs that signatories agreed to implement in good faith. For each BMP, the MOU established the actions required by the water supplier (e.g. site surveys, fixture and appliance rebates, water use budgets, volumetric pricing and conservation rate designs), the implementation schedule, and the required level of effort (in the MOU this is referred to as the coverage requirement). Additionally, the MOU established the terms by which a water supplier could opt out of implementing a BMP.

BMPs are grouped into five categories. Two categories, Utility Operations and Education, are "Foundational BMPs" because they are considered to be essential water conservation activities by any utility and are adopted for implementation by all signatories to the MOU as ongoing practices with no time limits. The remaining BMPs are "Programmatic BMPs" and are organized into Residential, Commercial, Industrial, and Institutional (CII), and Landscape categories. Table 6.1-1 shows the BMPs by category. The requirements and coverage levels of each BMP are set forth in Exhibit 1 of the MOU. As of the date of this UWMP, Cal Water is in process of completing and submitting BMP reports to the CUWCC for the period 2009-2010. Submission was delayed due to delays in the CUWCC reporting forms being made available.

Table 6.1-1: MOU Best Management Practices BMP Group BMP Name				
1. Utility Operations Programs (F)	Conservation Coordinator			
	Water Waste Prevention			
	Wholesale Agency Assistance Programs			
	Water Loss Control			
	Metering & Volumetric Rates			
	Retail Conservation Pricing			
2. Education Programs (F)	Public Information Programs			
	School Education Programs			
3. Residential (P)	Residential Assistance Program			
	Landscape Water Surveys			
	High Efficiency Clothes Washer Program			
	Watersense Toilet Program			
	Watersense Specifications for Residential Development			
4. Commercial, Industrial, Institutional (P)	Reduce baseline CII water use by 10% in 10 years			
5. Landscape (P)	Large Landscape Water Budget Programs			
	Large Landscape Water Surveys			

Under Flex Track, a water supplier can estimate the expected water savings over the 10-year period 2009-2018 if it were to implement the programmatic BMPs in accordance with the MOU's schedule, coverage, and exemption requirements, and then achieve these water savings through any combination of programs it desires. Thus, through the Flex Track compliance option, a water supplier agrees to save a certain volume of water using whatever it determines to be the best combination of programs. Because the savings target depends on the programmatic BMP coverage requirements, which in turn are functions of service area size and composition of demand, the volume of water to be saved under this compliance option must be calculated separately for each supplier. The methodologies and tools for water suppliers to implement these calculations are still being developed by the CUWCC.

Under the gpcd option, a water supplier can comply with the MOU by reducing its baseline gpcd by 18 percent by 2018. The baseline is the ten-year period 1997-2006. The MOU also establishes interim gpcd targets and the highest acceptable levels of water use deemed to be in compliance with this option. The MOU's gpcd option is similar to using Method 1 to set the SBx7-7 target, except that it uses a fixed baseline period and only runs through 2018. This compliance option may be difficult to achieve for Cal Water districts that are part of a regional alliance for purposes of SBx7-7 compliance because savings as a percent of demand will vary considerably among the districts in the alliance. It may also conflict with district-specific SBx7-7 targets set using method 3 (hydrologic region-based target). Because of these potential conflicts, this is not considered a viable MOU compliance option for Cal Water districts.

Cal Water plans to use Flex Track to comply with the MOU. This compliance option affords the most flexibility in selecting conservation programs suited to each Cal Water district and allows for more streamlined reporting. Because CUWCC tools for calculating a district's Flex Track savings target are not yet available, Cal Water developed its own target estimates for planning purposes. Cal Water will update these estimates as necessary following the release of the CUWCC Flex Track target calculator.

6.2 Conservation Master Plans

In an effort to address the statewide policies for urban water use reduction Cal Water developed Conservation Master Plans for each of its service districts. These Conservation Master Plans are designed to provide a framework for meeting these statewide policies and to chart a course for Cal Water's conservation programs over the next five years. The major tasks of the Conservation Master Plans include:

- 1. A complete review of State policies and development of a compliance strategy
- 2. Calculating all appropriate per capita targets
- 3. Determining water savings required from new programs
- 4. Performing an analysis of conservation programs
- 5. Developing a portfolio of conservation programs
- 6. Creating a plan for monitoring and update of Conservation Master Plans

Cal Water's Conservation Master Plans have a five year planning horizon and are designed to be updated in coordination with the UWMP for each district. The Conservation Master Plan for the Dominguez District is included in its entirety as Appendix G. A discussion of baseline and target water use can be found in Section 3 of this UWMP. A summary of the water savings requirements and program portfolio is summarized in the following section.

6.3 Water Savings Requirements

The gross water savings required under SBx7-7 can be determined with a simple calculation by subtracting the target water demand from the unadjusted baseline demand. According to this calculation the Dominguez District has a gross savings requirement of 1,695 AF from 2011-2015, as shown in Table 6.3-1.

Table 6.3-1: SBx7-7 and MOU Gross Water Savings Requirements					
Gross Water Savings Required by 2015	SBx7-7	MOU Flex Track			
2015 Unadjusted Baseline Demand	33,327 AF	33,327 AF			
2015 Target Demand	31,632 AF	32,592 AF			
Gross Savings Requirement	1,695 AF	735 AF			

As discussed earlier, because CUWCC tools for calculating a district's Flex Track savings target are not yet available, Cal Water developed its own target estimates for planning purposes. The targets are based on the expected water savings from cost-effective programmatic BMPs over the ten-year period 2009-2018. The coverage requirements for the programmatic BMPs were used to calculate the Flex Track targets. Expected water savings and cost-effectiveness were based on the conservation program specifications and avoided water supply costs. The supporting data and calculations are provided in Appendix G.

The differences between the unadjusted baseline demand, district-specific SBx7-7 target, and MOU Flex Track target are shown in Table 6.3-1. This shows the maximum amount of water savings needed for SBx7-7 compliance, as well as the savings required for MOU compliance. Because Dominguez District is part of a regional alliance, the amount of water savings needed for SBx7-7 compliance may turn out to be less than the amount shown in the table. Also, some of the reduction in baseline demand needed to achieve SBx7-7 and MOU compliance will come from efficiency codes, response to adjustments in rates, and savings from past program implementation. The remainder will need to come from new conservation program activity.

The unadjusted baseline demand described in Section 3 does not account for future changes in water demand due to the effects of plumbing fixture efficiency codes, changes in water rates, metering, and existing conservation programs. A portion of the gross savings requirements shown above are expected to come from these sources. The Conservation Master Plan includes an estimate of the volume of water saved as a result of these things. The results are used to adjust baseline demand so that the volume of water savings that will need to come from new conservation programs can be determined.

Two recent California laws are expected to accelerate the replacement of low efficiency plumbing fixtures – primarily toilets and showerheads – with higher efficiency alternatives.

- AB 715, passed in 2007, amended the California Building and Safety Code to require by January 1, 2014, that toilets sold or installed in California use no more than 1.28 gallons per flush. It also requires that urinals sold or installed use no more than 0.5 gallons per flush.
- SB 407, passed in 2009, amended the California Civil Code to require replacement of low efficiency plumbing fixtures with higher efficiency alternatives when a property undergoes alterations, improvements, or transfer. In the case of single-family residential properties, issuance of a certificate of final completion and occupancy or final permit approval by the local building department for building alterations or improvements will be conditional on the replacement of low efficiency plumbing fixtures beginning in 2014. Single-family property owners are required by law to replace any remaining non-compliant plumbing fixtures by no later than January 1, 2017. After this date, a seller or transferor of single-family residential real property must disclose in writing to the prospective purchaser or transferee whether the property includes any noncompliant plumbing fixtures. For multi-family and commercial properties non-compliant fixtures must be replaced by January 1, 2019. As with single-family properties, final permits or approvals for alterations or improvements are conditional on the replacement of low efficiency fixtures beginning in 2014.

The phase-in dates for AB 715 and SB 407 mean they will not greatly contribute to meeting the 2015 interim gpcd target under SBx7-7. But they will support meeting the 2020 target. Moreover, since the early 1990's, the sale and installation of toilets manufactured to flush more than 1.6 gallons, showerheads manufactured to have a flow capacity more than 2.5 gallons per minute, and interior faucets manufactured to emit more than 2.2 gallons per minute has been prohibited. These requirements will continue to improve the efficiency of plumbing fixtures in older residential and commercial buildings.

Water savings from expected rate adjustments in Dominguez District were also calculated. The estimates are based on inflation-adjusted changes in rates for 2011, 2012, and 2013, as contained in CPUC's proposed GRC decision. Short-run price elasticity estimates used to calculate potential changes in demand were drawn from the CUWCC's conservation rate guidebook.

The adjusted baseline demand and savings associated with code changes, rate changes, and existing conservation programs are shown in Table 6.3-2.

Table 6.3-2: Adjusted Baseline Demand Projection						
Adjusted Baseline (AF) 2011 2012 2013 2014						
Unadjusted Baseline	32,832	32,954	33,079	33,202	33,327	
Less Savings from						
Codes	57	109	160	210	269	
Schedule Rate Increases	162	287	366	283	97	
Existing Programs	32	32	31	27	22	
Adjusted Baseline Demand	32,580	32,527	32,522	32,683	32,939	
Per Capita (GPCD)	201	200	200	200	201	

The amount of water savings required from new conservation programs is not the same for SBx7-7 and MOU Flex Track compliance. In the case of SBx7-7, the objective is to reduce 2015 per capita water use at least to the target of 219 gpcd, and any expected savings from codes, rates, and existing conservation programs can be credited toward meeting this goal. This is not the case for MOU Flex Track compliance, where the objective is to implement conservation programs that would save at least as much as the Flex Track target. Unlike SBx7-7, water savings from codes and rates cannot be credited against the Flex Track target. Only savings from existing conservation programs can be deducted.

Savings required from new conservation programs to meet SBx7-7 and MOU Flex Track compliance requirements are summarized in Table 6.3-3. In the case of SBx7-7, 2015 potable demand, after accounting for codes, scheduled changes in rates, and 2009-10 conservation program activity, is projected to be 1,307 AF over the level required for SBx7-7 compliance. In the case of MOU Flex Track Compliance, water savings from conservation programs implemented in 2009 and 2010 are expected to generate about 22 AF of savings in 2015. Thus conservation programs implemented over the period 2011-2015 will need to save an additional 713 AF by 2015 for Dominguez District to be in compliance with the MOU.

Table 6.3-3: New Program Savings Required for SBx7-7 and MOU Compliance				
2015 Net Savings Requirement (AF)	SBx7-7	MOU Flex Track		
Gross Savings Requirement	1,695	735		
Less				
Savings from codes	269	NA		
Savings from rates	97	NA		
Savings from existing programs	<u>22</u>	<u>22</u>		
Subtotal Expected Savings	388	22		
Savings Required from New Programs ¹ 1,307 71				
¹ Negative net savings indicates that no new program savings required for compliance				

6.4 Conservation Program Analysis

Cal Water engaged in a detailed, multi-step process to identify the best mix of programs to achieve the required savings. The process began with an inclusive range of potential program concepts. These concepts were qualitatively analyzed to eliminate those that were clearly inappropriate for each district and thereby narrow the analytical focus to those remaining programs that were potentially appropriate. Those programs were then subjected to detailed quantitative analysis. This section describes the steps of the analytical process for Dominguez District, and the programs that emerged as potential components of a portfolio of programs for the district.

As a result of an exhaustive search of the literature, consultation with experts in the field, knowledge of conservation programming by other water suppliers, and the experience of the project team, a total of more than 75 conservation program concepts were defined. At this point in the process, the goal was to be as inclusive as possible. The list was therefore intentionally large to ensure that all possible program concepts were considered. Cal Water did not want to risk inadvertently excluding a program from consideration.

Once the range of program concepts was defined, the next step was to subject each program concept to a careful district-specific qualitative screen, the objective of which was to eliminate those program concepts that were clearly inappropriate.

A preliminary quantitative analysis was conducted on the programs that passed the qualitative screen. To do that, estimates were made of key savings and cost parameters for each of the programs. Where applicable, these estimates were based on prior Cal Water experience with similar programs. In the absence of such experience, the experience of other water suppliers, the expertise of the project team, consultation with national experts, and published figures, where available, were relied upon. In particular, estimates developed by the California Urban Water Conservation Council and the Alliance for Water Efficiency were utilized where such estimates were available. While

in most cases, the savings assumptions for a program do not vary across districts, for several programs, they do due to district-specific characteristics of household size, climate, etc. Other than meter installation, program cost assumptions are uniform across districts, although in some cases, cost sharing with other water utilities reduce Cal Water's share.

Using the results of the qualitative screening and preliminary quantitative analysis, Cal Water identified five core programs that it would run in every district over the next five years. In addition to the core programs, an additional set of non-core programs was selected. Unlike core programs, Cal Water may not offer non-core programs in every district or in every year. Implementation of non-core programs will depend on whether additional water savings are required for SBx7-7 compliance, MOU compliance, or to help address local supply constraints. Table 6.4-1 lists all Cal Water core and non-core conservation programs.

Table 6.4-1: Cal Water Conservation Programs				
Program Name	Description	Target Market		
Rebate/Vouchers for toilets, urinals, and clothes washers	Provide customer rebates for high-efficiency toilets, urinals, and clothes washers	All customer segments		
Residential Surveys	Provide residential surveys to low-income customers, high-bill customers, and upon customer request or as pre-screen for participation in direct install programs	All residential market segments		
Residential Showerhead/Water Conservation Kit Distribution	Provide residential showerhead/water conservation kits to customers upon request, as part of residential surveys, and as part of school education curriculum	All residential market segments		
Pop-Up Nozzle Irrigation System Distribution	Offer high-efficiency pop-up irrigation nozzles through customer vouchers or direct install.	All customer segments		
Public Information/Education	Provide conservation messaging via radio, bill inserts, direct mail, and other appropriate methods. Provide schools with age appropriate educational materials and activities. Continue sponsorship of Disney Planet Challenge program.	All customer segments		
	NON-CORE PROGRAMS			
Toilet/Urinal Direct Install Program	Offer direct installation programs for replacement of non-HE toilets and urinals	All customer segments		
Smart Irrigation Controller Contractor Incentives	Offer contractor incentives for installation of smart irrigation controllers	All customer segments		
Large Landscape Water Use Reports	Expand existing Cal Water Large Landscape Water Use Report Program providing large landscape customers with monthly water use reports and budgets	Non residential customers with significant landscape water use and potential savings		

Large Landscape Surveys &	Provide surveys and irrigation system	Non residential	
Irrigation System Incentives	upgrade financial incentives to large	customers with	
	landscape customers participating in the	significant landscape	
	Large Landscape Water Use Reports	water use and potential	
	programs and other targeted customers	savings	
Food Industry Rebates/Vouchers	Offer customer/dealer/distributor	Food and drink	
-	rebates/vouchers for high-efficiency	establishments,	
	dishwashers, food steamers, ice machines,	institutional food service	
	and pre-rinse spray valves	providers	
Cooling Tower Retrofits	Offer customer/dealer/distributor	Non-residential market	
	rebates/vouchers of cooling tower retrofits	segments with	
		significant HVAC water	
		use	
Industrial Process Audits and	Offer engineering audits/surveys and	Non-residential market	
Retrofit Incentives	financial incentives for process water	segments with	
	efficiency improvement	significant industrial	
		process water uses	

Core and non-core programs were then subjected to a detailed benefit cost analysis, the results of which were used to inform program portfolio development discussed in the next section. The first step in this process was to refine and finalize the savings and cost specifications of each program. The program savings and cost assumptions enable the calculation of program benefits and costs to the utility and its ratepayers, and comparisons of these costs in the form of benefit-cost ratios. The tool used to do this comparison was a simplified version of the Alliance for Water Efficiency Tracking Tool. Following are descriptions of how the model calculates and compares conservation program benefits and costs.

6.5 Conservation Program Portfolio

This section presents the recommended conservation program portfolio for the Dominguez District. The program analysis results described in the previous section provided the starting point for portfolio development. The next step was to determine the annual levels of program activity needed to, at minimum, meet Dominguez District's water savings targets and local demand management goals. Several considerations informed these decisions, including budgetary constraints included in the current GRC decision, Cal Water conservation program administrative capacity, program market and water savings potential, and the program benefit-cost results.

The water savings requirement analysis showed that, after accounting for water savings from existing water efficiency codes and ordinances, scheduled adjustments to water rates, and past investment in conservation programs, projected 2015 baseline demand (excluding recycled water use) in Dominguez District is 1,307 AF over the level required for SBx7-7 compliance. The analysis also showed that 713 AF of water savings from new programs would be required to satisfy MOU compliance requirements in 2015. The program recommendations presented in this section are designed to help the district meet

both requirements. For the Dominguez District, the programs selected and the activity level of each are shown in Table 6.5-1.

Table 6.5-1: Recommended Program Levels					
Program	Recommended Annual Activity Levels				
	2011	2012	2013	2014	2015
CORE PROGRAMS					
Rebates/Vouchers					
Toilets	830	830	830	1,280	1,280
Clothes Washers	590	590	590	610	610

Commercial Kitchen Rebates/Vouchers	0	0	0	60	60
Cooling Tower/Process Water Retrofit Incentives	50	50	50	20	20

The program levels for 2011-2013 reflect the funding level approved in Cal Water's most recent General Rate Case (GRC) settlement with the CPUC. Program levels for 2014 and 2015 will be dependent on the outcome of Cal Water's 2014-2016 GRC filing.

Table 6.5-2 shows projected water savings associated with the programs listed above.

Table 6.5-2: Projected Water Savings by Program					
Program		Annual V	Vater Savin	gs (AF)	
	2011	2012	2013	2014	2015
CORE PROGRAMS					
Rebates/Vouchers					
Toilets	24.5	48.0	70.6	105.5	139.0
Clothes Washers	10.9	21.3	31.3	41.2	50.6
Urinals	0.0	0.0	0.0	0.0	0.0

Incentives	58.6	117.3	175.9	194.2	212.4
Subtotal Non-Core Programs	93.9	182.8	270.8	413.4	547.1
Total Core and Non-Core Program Savings	207.3	403.5	593.6	864.0	1,118.6

Based on the above analysis the district is not projected to achieve its district-specific 2015 SBx7-7 compliance target through the combination of passive savings and the proposed 2011-2015 conservation program portfolio. However, it will achieve compliance with its 2015 SBx7-7 compliance target through the regional alliance. The district may ultimately elect to achieve 2020 SBx7-7 compliance through a regional alliance also. Appendix C, Worksheet 24, includes a comparison of conservation savings required to meet SBx7-7 compliance targets to the savings expected as a result of existing and planned programs, including passive savings due to code changes.

For the purpose of this analysis it is assumed that there will be a linear reduction in GPCD from 2015-2020 to achieve the district-specific 2020 SBx7-7 compliance target. Programs required to achieve 2020 SBx7-7 compliance will be outlined in the next Conservation Master Plan for the district, which will be included in the 2015 UWMP. The activity level of each future program will depend on Cal Water's success in obtaining the necessary funding through the CPUC rate case process.

As part of the Conservation Master Plan development, one page program summaries, or fact sheets, were developed for each recommended program. These fact sheets provide a quick reference summarizing program design and marketing, expected level of customer participation, projected water savings, and proposed program expenditure for the period 2011-2015. The fact sheets for the Dominguez District are included in Appendix G.

7 Climate Change

7.1 Introduction

Investigating climate change brings the prospect of examining both model-predicted outcomes and unforeseen changes to the environment. These changes may physically affect the water districts that Cal Water serves. Climate change does not just mean a change in average temperature within any particular region, but a change in the climatic conditions that creates or results in an increase in extreme weather events. These potential changes include a more variable climate with risks of extreme climate events that are more severe than those in the recent hydrologic record, in addition to sea level rise, a hotter and drier climate, and the likelihood that more of the uplands precipitation will fall as rain and not as snow.

7.2 Strategy

Cal Water intends to prepare a Climate Assessment Report in 2013 that will examine the regional impacts on water supply for each of its 24 service areas. This report will review any supply changes that may occur due to climate change and will outline mitigation and adaption methods to meet the needs of the District's service area. The following section, adapted from DWR's *Guidebook to Assist Water Suppliers to Prepare a 2010 Urban Water Management Plan*, provides a range of topics to be examined in Cal Water's Climate Assessment Report.

Responding to climate change generally takes two forms: mitigation and adaptation. Mitigation is taking steps to reduce our contribution to the causes of climate change by reducing greenhouse gas (GHG) emissions. Adaptation is the process of responding to the effects of climate change by modifying our systems and behaviors to function in a warmer climate. Regardless if climate change is manmade or a result of natural climate cycles, investigating mitigation and adaptive methods to better manage possible uncertainties in climatic changes will have more immediate benefits such as: cutting carbon emissions, reducing energy usage, possible economic development at the local level, and financial savings for Cal Water and the ratepayers.

Mitigation

In the water sector, climate change mitigation is generally achieved by reducing energy use, becoming more efficient with energy use, and/or substituting fossil fuel based energy sources for renewable energy sources. Water requires energy to move, treat, use, and discharge, thus water conservation is energy conservation. One possible mitigation method is to calculate conserved energy and GHGs not-emitted as water conservation targets are being met.

Adaptation

Climate change means more than just hotter days. Continued warming of the climate system may have considerable impact on the operation of Cal Water Districts, even if indirectly. For example, snow in the Sierra Nevada provides 65 percent of California's

water supply. Predictions indicate that by 2050 the Sierra snowpack will be significantly reduced. Much of the lost snow will fall as rain, which flows quickly down the mountains during winter and cannot be stored in the current water system for use during the summer. This change in water runoff may severely impact groundwater recharge and other water supply networks. The climate is also expected to become more variable, bringing more droughts and floods. Cal Water districts will have to adapt to these new and more variable conditions.

7.3 Potential Climate Change Effects

Even in the near term of the next 20 years, DWR has outlined potential climate change effects to water supplies, water demand, sea level, and the occurrence and severity of natural disasters. Some of these potential changes are presented below. Cal Water will investigate the following climate change and the effects on Cal Water's Districts:

- Water Demand Hotter days and nights, as well as a longer irrigation season, will
 increase landscaping water needs, and power plants and industrial processes will have
 increased cooling water needs.
- Water Supply and Quality Reduced snowpack, shifting spring runoff to earlier in the year, increased potential for algal bloom, and increased potential for seawater intrusion—each has the potential to impact water supply and water quality.
- Sea Level Rise It is expected that sea level will continue to rise, resulting in near shore ocean changes such as stronger storm surges, more forceful wave energy, and more extreme tides. This will also affect levee stability in low-lying areas and increase flooding.
- Disaster Disasters are expected to become more frequent as climate change brings increased climate variability, resulting in more extreme droughts and floods. This will challenge water supplier operations in several ways as wildfires are expected to become larger and hotter, droughts will become deeper and longer, and floods can become larger and more frequent.

7.4 Historical Climate Data Summary

The National Climatic Data Center (NCDC) has established 11 climate regions within California. Each region is defined be unique characteristics, and is shown in Figure 7.4-1.

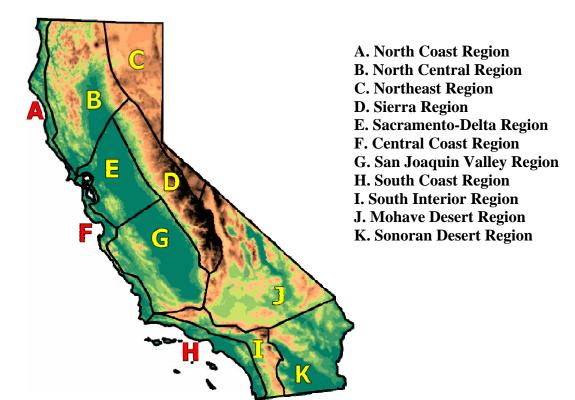

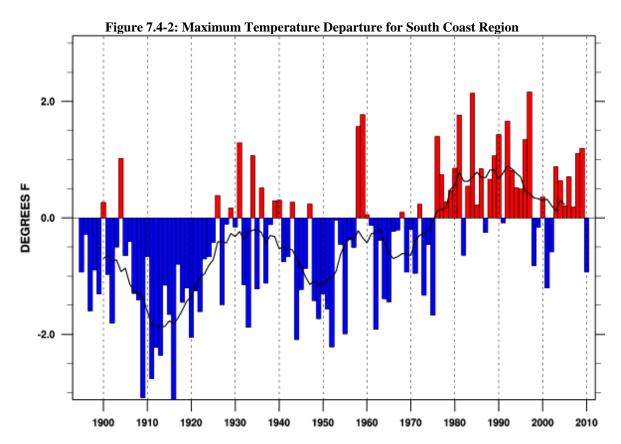

Figure 7.4-1: The Climate Regions of California⁵

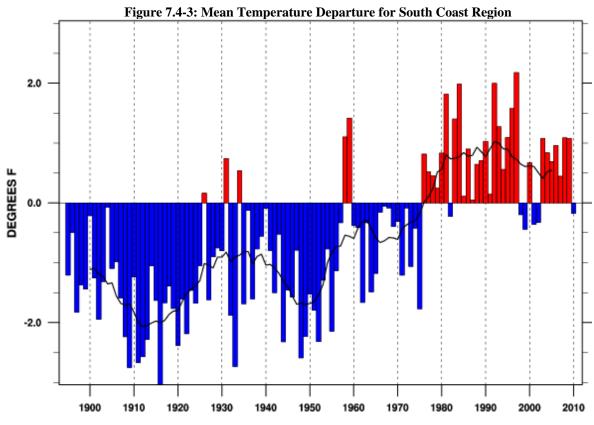

Cal Water has water service districts in 7 out of 11 of the climate regions. The Dominguez District is located in the South Coast Region, as listed in Table 7.4-1.

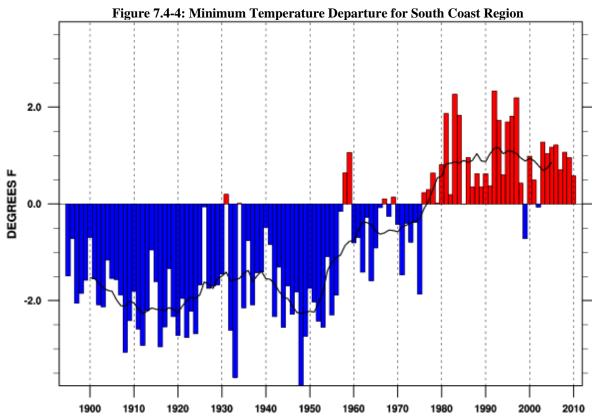

Table 7.4-1: Cal Water Districts Sorted by Climate Region				
Climate Region	Cal Water Districts in Each Climate Region			
North Coast Region	None			
North Central Region	Chico-Hamilton City, Redwood Valley			
Northeast Region	None			
Sierra Region	Kern River Valley			
Sacramento-Delta Region	Dixon, Livermore, Marysville, Oroville, Stockton, Willows			
Central Coast Region	Bear Gulch, Los Altos, Mid-Peninsula, Salinas, South San Francisco			
San Joaquin Valley Region	Bakersfield, King City, Selma, Visalia			
South Coast Region	Dominguez , East LA, Hermosa-Redondo, Palos Verdes, Westlake			
South Interior Region	None			
Mojave Desert Region	Antelope Valley			
Sonoran Desert Region	None			

 $^{^{5}\ \}underline{\text{http://www.wrcc.dri.edu/monitor/cal-mon/frames_versionSTATIONS.html}}$

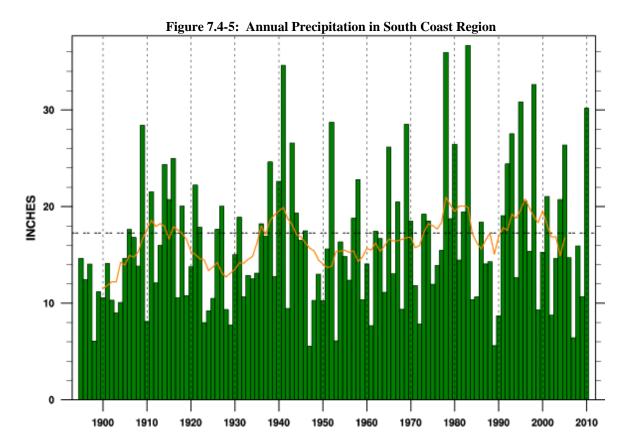

The region has experience a general warming trend as indicated by the maximum, minimum, and mean temperature departure from average. Since 1895 these values have increased by 1.74°F, 3.19°F, and 2.47°F, respectively. More recently, since 1975, the maximum, minimum, and mean temperature departures have increased -0.76°F, 1.76°F, and 0.49°F, respectively. The historical data for these parameters are shown in Figures 7.4-2, 7.4-3, and 7.4-4.

Variation in annual rainfall totals has also shown an increasing trend since 1900 with more deviation from average occurring in recent decades as compared to earlier part of the century.

Historical data is showing a general correlation as to the general consensus for the different climate change scenarios. As stated above, a more comprehensive investigation will be prepared by Cal Water in 2013. The outcome of this report will outline mitigation and adaptation methods that will provide water supply reliability for Cal Water's service areas.

7.5 Climate Change Guidance

The California Department of Water Resources is currently in the process of compiling the potential actions and responses to climate change in the Integrated Regional Water Management (IRWM) climate change handbook. This handbook will provide guidance to water utilities for planning for the potential impacts of climate change and will offer a framework for responding to these impacts. Cal Water will review this handbook and other available literature when developing localized strategies for each of its water service districts.

8 Completed UWMP Checklist

8.1 Review Checklist

Table 8.1-1, adapted from DWR's *Guidebook to Assist Water Suppliers to Prepare a 2010 Urban Water Management Plan*, is included as a reference to assist DWR staff in review of this UWMP.

Table 8.1-1: Urban Water Management Plan Checklist (organized by legislation number) Calif. Water Code Subject b Additional clarification location						
		reference				
1	Provide baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.	10608.20(e)	Water Conservation		3.3.1	
2	Include an assessment of present and proposed future measures, programs, and policies to help achieve the water use reductions.	10608.36	Water Conservation		6.4	
3	Report progress in meeting urban water use targets using the standardized form.	10608.4	Water Conservation		Appendix G	
4	Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.	10620(d)(2)	External Coordination and Outreach		1.2	
5	An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.	10620(f)	Water Supply (Water Management)		1.4	
6	Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days prior to the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision.	10621(b)	External Coordination and Outreach		1.2	
7	The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).	10621(c)	External Coordination and Outreach		1.2	
8	Describe the service area of the supplier	10631(a)	Service Area		2.1	
9	(Describe the service area) climate	10631(a)	Service Area		2.3	
10	(Describe the service area) current and projected population The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier	10631(a)	Service Area	Provide the most recent population data possible. Use the method described in "Baseline Daily Per Capita Water Use." See Section M.	2.2	

11	(population projections) shall be in five-year increments to 20 years or as far as data is available.	10631(a)	Service Area	2035 and 2040 can also be provided to support consistency with Water Supply Assessments and Written Verification of Water Supply documents.	2.2
12	Describe other demographic factors affecting the supplier's water management planning	10631(a)	Service Area		2.2
13	Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a).	10631(b)	Water Supply	The 'existing' water sources should be for the same year as the "current population" in line 10. 2035 and 2040 can also be provided to support consistency with Water Supply Assessments and Written Verification of Water Supply documents.	4.1
14	(Is) groundwater identified as an existing or planned source of water available to the supplier?	10631(b)	Water Supply	Source classifications are: surface water, groundwater, recycled water, storm water, desalinated sea water, desalinated brackish groundwater, and other.	4.4
15	(Provide a) copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management. Indicate whether a groundwater management plan been adopted by the water supplier or if there is any other specific authorization for groundwater management. Include a copy of the plan or authorization.	10631(b)(1)	Water Supply		4.4.2
16	(Provide a) description of any groundwater basin or basins from which the urban water supplier pumps groundwater.	10631(b)(2)	Water Supply		4.4.1

	For those basins for which a court or the board has				
17	adjudicated the rights to pump groundwater, (provide) a copy of the order or decree adopted by the court or the board	10631(b)(2)	Water Supply		Appendix I
18	(Provide) a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree.	10631(b)(2)	Water Supply		4.4
19	For basins that have not been adjudicated, (provide) 10631(b)(2) Water Supply information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to eliminate the long-term overdraft condition.	10631(b)(2)	Water Supply		4.4.1
20	(Provide a) detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.	10631(b)(3)	Water Supply		4.4
21	(Provide a) detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.	10631(b)(4)	Water Supply	Provide projections for 2015, 2020, 2025, and	4.4
22	Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following: (A) An average water year, (B) A single dry water year, (C) Multiple dry water years.	10631(c)(1)	Reliability		5.3
23	For any water source that may not be available at a consistent level of use - given specific legal, environmental, water quality, or climatic factors - describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.	10631(c)(2)	Reliability		5.1
24	Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.	10631(d)	Water Supply (Transfers)		4.7
25	Quantify, to the extent records are available, past and current water use, and projected water use (over the same five-year increments described in subdivision (a)), identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses: (A) Single-family residential; (B) Multifamily; (C) Commercial; (D) Industrial; (E) Institutional and governmental; (F) Landscape; (G) Sales to other agencies; (H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof; (I) Agricultural.	10631(e)(1)	Water Demands	Consider "past" to be 2005, present to be 2010, and projected to be 2015, 2020, 2025, and 2030. Provide numbers for each category for each of these years.	3.3

26	(Describe and provide a schedule of implementation for) each water demand management measure that is currently being implemented, or scheduled for implementation, including the steps necessary to implement any proposed measures, including, but not limited to, all of the following: (A) Water survey programs for single-family residential and multifamily residential customers; (B) Residential plumbing retrofit; (C) System water audits, leak detection, and repair; (D) Metering with commodity rates for all new connections and retrofit of existing connections; (E) Large landscape conservation programs and incentives; (F) Highefficiency washing machine rebate programs; (G) Public information programs; (H) School education programs; (I) Conservation programs for commercial, industrial, and institutional accounts; (J) Wholesale agency programs; (K) Conservation pricing; (L) Water conservation coordinator; (M) Water waste prohibition; (N) Residential ultra low-flush toilet replacement programs.	10631(f)(1)	DMMs	Discuss each DMM, even if it is not currently or planned for implementation. Provide any appropriate schedules.	6.5
27	A description of the methods, if any, that the supplier will use to evaluate the effectiveness of water demand management measures implemented or described under the plan.	10631(f)(3)	DMMs		6.2
28	An estimate, if available, of existing conservation savings on water use within the supplier's service area, and the effect of the savings on the supplier's ability to further reduce demand.	10631(f)(4)	DMMs		6.3
29	An evaluation of each water demand management measure listed in paragraph (1) of subdivision (f) that is not currently being implemented or scheduled for implementation. In the course of the evaluation, first consideration shall be given to water demand management measures, or combination of measures, that offer lower incremental costs than expanded or additional water supplies. This evaluation shall do all of the following: (1) Take into account economic and noneconomic factors, including environmental, social, health, customer impact, and technological factors; (2) Include a cost-benefit analysis, identifying total benefits and total costs; (3) Include a description of funding available to implement any planned water supply project that would provide water at a higher unit cost; (4) Include a description of the water supplier's legal authority to implement the measure and efforts to work with other relevant agencies to ensure the implementation of the measure and to share the cost of implementation.	10631(g)	DMMs	See 10631(g) for additional wording.	6.4

30	(Describe) all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs, other than the demand management programs identified pursuant to paragraph (1) of subdivision (f), that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.	10631(h)	Water Supply		4.9
31	Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.	10631(i)	Water Supply		4.6
32	Include the annual reports submitted to meet the Section 6.2 requirement (of the MOU), if a member of the CUWCC and signer of the December 10, 2008 MOU.	10631(j)	DMMs	Signers of the MOU that submit the biannual reports are deemed	6.5
33	Urban water suppliers that rely upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c).	10631(k)	Water Supply	Average year, single dry year, multiple dry years for 2015, 2020, 2025, and 2030.	4.2
34	The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.	10631.1(a)	Water Demands		3.3.2
35	Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions which are applicable to each stage.	10632(a)	Contingency		5.3.5
36	Provide an estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.	10632(b)	Contingency		5.2

37	(Identify) actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.	10632(c)	Contingency	5.3.9
38	(Identify) additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.	10632(d)	Contingency	5.3.7
39	(Specify) consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.	10632(e)	Contingency	5.3.5
40	(Indicated) penalties or charges for excessive use, where	10632(f)	Contingency	5.3.7
41	applicable. An analysis of the impacts of each of the actions and conditions described in subdivisions (a) to (f), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.	10632(g)	Contingency	5.3.8
42	(Provide) a draft water shortage contingency resolution or ordinance.	10632(h)	Contingency	5.3
43	(Indicate) a mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.	10632(i)	Contingency	5.3.7
44	Provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area	10633	Recycled Water	4.5
45	(Describe) the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.	10633(a)	Recycled Water	4.5.1
46	(Describe) the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.	10633(b)	Recycled Water	4.5.2
47	(Describe) the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.	10633(c)	Recycled Water	4.5.3
48	(Describe and quantify) the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.	10633(d)	Recycled Water	4.5.3
49	(Describe) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.	10633(e)	Recycled Water	4.5.3

		ı	ı	1	
50	(Describe the) actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.	10633(f)	Recycled Water		4.5
51	(Provide a) plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.	10633(g)	Recycled Water		4.5
52	The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.	10634	Water Supply (Water Quality)	For years 2010, 2015, 2020, 2025, and 2030	5.2.4
53	Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.	10635(a)	Reliability		5.2
54	The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.	10635(b)	External Coordination and Outreach		1.2
55	Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan.	10642	External Coordination and Outreach		1.2
56	Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon. Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area.	10642	External Coordination and Outreach		1.2
57	After the hearing, the plan shall be adopted as prepared or as modified after the hearing.	10642	External Coordination and Outreach		1.3
58	An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan.	10643	External Coordination and Outreach		1.6

59	An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.	10644(a)	External Coordination and Outreach	1.3	
60	Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.	10645	External Coordination and Outreach	1.3	

^a The UWMP Requirement descriptions are general summaries of what is provided in the legislation. Urban water suppliers should review the exact legislative wording prior to submitting its UWMP.

^b The Subject classification is provided for clarification only. A water supplier is free to address the UWMP Requirement anywhere with its UWMP, but is urged to provide clarification to DWR to facilitate review for completeness.
